### **Abstract**

This report considers the analytical potential of the classification system of policy measures in the OECD Producer Support Estimate (PSE) to monitor policy developments. This system of categories, subcategories and labels is based on the form in which transfers are provided to farmers. The analysis of data relating to categories, subcategories and labels of the PSE classification allows for a critical examination of the strengths and weakness of the PSE classification system. While this system provides a useful picture of some important differences in the way agricultural support policy is implemented over time and between countries, it is obviously limited by the pre-defined categories and labels. But the database also contains a wealth of information on each policy measures, which can be drawn upon for more detailed analysis.

**Key Words:** Agricultural policy, agricultural support, producer support, PSE, composition of support, policy monitoring and evaluation.

## ANALYSING THE COMPOSITION OF PRODUCER SUPPORT: NEW TOOLS AND METHODS

After a period of consultation between the OECD Secretariat, member countries and experts, a revised classification system of categories, sub-categories and labels relating to the Producer Support Estimate (PSE) was introduced in 2007. The revised classification system was necessitated by the continuing evolution of agricultural policy in OECD countries. The revised PSE classification system does not change the methodology for calculating the level of producer support. Rather it changes the way in which the composition of producer support – the form in which transfers are provided to farmers – can be used to monitor and evaluate policy developments. Changes in the composition of producer support have, over time, become an increasingly important element in assessing the reform of agricultural policies.

By expanding the number of categories into which policy measures are classified and introducing six labels that are assigned to individual policy measures the revised PSE classification system has improved the analytical potential of the OECD support indicators to monitor and evaluate the composition of support. However, it has also greatly increased the complexity of the database.

This report considers the analytical potential of the revised system of categories, subcategories and labels to monitor policy developments. It critically examines the strengths and weakness of the current classification system.

### 1. Introduction

The purpose of this report is to examine the analytical potential of the current PSE classification system introduced in 2007 to monitor and evaluate developments in agricultural policy. Important questions are whether the most relevant labels are adequately presented in the annual reports (on *Agricultural Policies in OECD Countries: Monitoring and Evaluation or At a Glance*, and whether further refinements would improve the analytical capacity of the database.

This report begins by explaining the development of the PSE classification system and defining the terminology used in the analysis. It then considers, from a theoretical viewpoint, what the various categories and labels can reveal about policy measures, with reference made to important characteristics of policy reform as agreed to by OECD Agriculture Ministers, namely decoupling, targeting and tailoring. This is followed by a brief account of three efforts made to use the revised classification system to monitor and evaluate policy developments since it was introduced: the annual report *Agricultural Policies in OECD Countries: Monitoring and Evaluation 2009* (OECD, 2009a), risk-related policies (OECD, 2009b) and agri-environmental payments (Chapter 2 in OECD, 2009a). The next section then analyses information contained in the PSE/CSE database by country, category and label. The analysis has been undertaken to show the extent to

which the information contained in the PSE/CSE database made publicly available can be used by anyone. The final section reviews the extent to which the PSE classification system has achieved its analytical potential. Annex 1 gives the names and definitions of the PSE categories and labels, while Annex 2 contains detailed tables on the composition of the PSE.

## 2. Background<sup>1</sup>

Since it began monitoring and evaluating support to the agricultural sector in the mid-1980s, the OECD has always incorporated a system for classifying policy measures into different categories of support to provide a means for evaluating policy changes against the OECD Ministerial criteria for policy reform. There were originally five PSE categories, with policy measures classified according to the type of support: Market Price Support (MPS), Direct payments, Reduction in input costs, General Services and Other. At that time the vast majority of support to producers was provided through MPS policy measures (*e.g.* import quotas, high tariffs and export subsidies) and deficiency payments linked directly to the production of specific commodities. Since then a broader and more complex range of policy measures supporting agriculture has been implemented across the OECD.

These changes reflect, among other things, the move to “decouple” the provision of support from specific commodity production and “re-couple” the provision of support to other criteria. Policies increasingly deliver transfers not on the basis of commodity output but on other bases such as farmed area, overall farm income or non-commodity criteria. Many policies now provide support on the basis of a mixture of “current and past prices and production”, often with constraints imposed on the conditions under which farmers are eligible for payments. In addition, OECD analysis of the impacts of policy measures on production, trade, income and the environment has shown that it is not just the level of support but the way in which the policy measure is implemented and the conditions attached to the granting of support that determines the effect of policy measures on such factors, and that these effects can vary widely between policy measures. These developments have led to a greater focus on the composition of support in the monitoring and evaluation of agricultural policy reform.

Two major changes to the classification system were introduced in 1999. First, policy measures that provide support to producers collectively through “general services” to the agricultural sector were separated out from the PSE and captured within their own indicator – the General Services Support Estimate (GSSE). As a result, the PSE includes only the value of transfers arising from policy measures that support producers individually. Second, within the PSE, policy measures were classified into seven categories that reflected *implementation criteria*, *i.e.* the conditions under which the associated transfers are provided to farmers, or the conditions of eligibility for the payment: MPS, Payments based on output, Payments based on area/animal numbers, Payments based on historical entitlements, Payments based on input use, Payments based on input constraints and Miscellaneous.

Although this represented a significant improvement in the ability to analyse the composition of support, continuing changes in the design of often complex agricultural policy made it increasingly difficult to classify new policy measures into the existing

---

1. A fuller explanation of the PSE classification system and its history can be found in *The PSE Manual* (OECD, 2008a).

categories. Consequently, a revised PSE classification system was adopted in 2007, consisting of two major developments: the revision of categories and the introduction of labels.

First, while still based on implementation criteria, the categories were revised and expanded. There are now fourteen PSE categories at the detailed (or sub-category) level, which are combined into seven “first-order” categories. These categories are listed as rows in Table 2.1, with full definitions given in Annex 1.

It should be noted that the categories can be referred to by both an alpha-numerical annotation (A2, C, F3) and a category name abbreviation (mnemonics) system as used in the PSE/CSE database, *e.g.* the category “Payments based on output” is referred to as both category A2 and abbreviation PO. All PSE data back to 1986 are now classified under this system.

The criteria for classifying a policy measure into a specific PSE category are expressed through a standard sequence of questions (decision tree). These are asked with regard to each policy measure in order to correctly and consistently classify them. Although a policy measure may be conditional on several of the criteria, it is classified under the first applicable criterion. Full information on how each policy measure is classified in individual countries is contained in the “Definitions and Sources” documents available on the web-site for each country.

Secondly, labels were introduced. When a policy measure is classified into a particular PSE category, it is also assigned several labels that provide additional details on implementation criteria. The six sets of labels are listed as columns in Table 2.1, with full definitions given in Annex 1. Three of the sets offer a choice between two labels (*e.g.* policy measures are labelled as having either a “fixed” or “variable” payment rate), two offer three alternatives and one offers four alternatives. The alternatives offered by each set of labels are mutually exclusive, so that only one of the available options for each label can be attributed to a policy measure.

Table 2.1. PSE categories and labels

CATEGORIES, first-order	CATEGORIES, detailed (or sub-categories)	LABELS					
		Current commodity production and payment limits	Payment rates	Input constraints	Payment eligibility based on	Payment eligibility based on	Production Exceptions
		Limit/ No Limit	Fixed/ Variable	With (mandatory)/ With (voluntary)/ Without	Single Commodity/ Group of Commodities / All Commodities	Area/ Animal number/ Receipts/ Income	With/ Without
A. Support based on commodity output (CO)	A1. Market Price Support (MPS)	Y/N	F/V	n.a.	SC/GC/AC	n.a.	n.a.
	A2. Payments based on output (PO)	Y/N	F/V	M/V/No	SC/CG/AC	n.a.	n.a.
B. Payments based on input use (PI)	B1. Variable input use (PIV)	Y/N	F/V	M/V/No	SC/CG/AC	n.a.	n.a.
	B2. Fixed capital formation (PIF)	Y/N	F/V	M/V/No	SC/CG/AC	n.a.	n.a.
	B3. On-farm services (PIS)	Y/N	F/V	M/V/No	SC/CG/AC	n.a.	n.a.
C. Payments based on current A/An/R/I, production required (PC)	C1. Based on current receipts/income	Y/N	F/V	M/V/No	SC/CG/AC	R/I	n.a.
	C2. Based on current area/animal numbers	Y/N	F/V	M/V/No	SC/CG/AC	A/An	n.a.
D. Payments based on non-current A/An/R/I, production required (PHR)	D. Payments based on non-current A/An/R/I, production required	Y/N	F/V	M/V/No	SC/CG/AC	A/An/R/I	n.a.
E. Payments based on non-current A/An/R/I, production not required (PHNR)	E1. Paid at variable rates	Y/N	V	M/V/No	n.a.	A/An/R/I	Y/N
	E2. Paid at fixed rates	Y/N	F	M/V/No	n.a.	A/An/R/I	Y/N

Table 2.1. PSE categories and labels (cont.)

CATEGORIES, first-order	CATEGORIES, detailed (or sub-categories)	LABELS					
		Current commodity production and payment limits	Payment rates	Input constraints	Payment eligibility based on	Payment eligibility based on	Production Exceptions
		Limit/ No Limit	Fixed/ Variable	With (mandatory)/ With (voluntary)/ Without	Single Commodity/ Group of Commodities / All Commodities	Area/ Animal number/ Receipts/ Income	With/ Without
F. Payments based on non-commodity criteria (PN)	F1. Long-term resource retirement (PNLT)	Y/N	n.a.	V	n.a.	n.a.	n.a.
	F2. A specific non-commodity output (PNSO)	Y/N	n.a.	V	n.a.	n.a.	n.a.
	F3. Other non-commodity criteria (PNOP)	Y/N	n.a.	n.a.	n.a.	n.a.	n.a.
G. Miscellaneous (PM)	G. Miscellaneous (PM)	n.a.	n.a.	n.a.	n.a.	n.a.	n.a.

Y/N: Yes or no; F/V: Fixed or Variable; M/V/No: Mandatory constraint/Voluntary constraint/without constraint; A/An/R/I – Area/Animal numbers/Receipts/Income;

“n.a.” – PSE label not applicable to policy measures in a given category; “SC” and “With (vol)”– these PSE labels are applicable to policy measures in a given category by definition

1. Definitions of the categories and labels are contained in Annex 1.

2. Category abbreviations (in brackets) are those used in the PSE/CSE database.

Labels therefore offer the potential to analyse the composition of producer support from different perspectives, producing aggregations of transfers that emphasize a specific implementation criteria used in the policies applied. However, not all labels are applicable to all PSE categories. For example, as shown in Table 2.1, the label specifying whether a payment is based on a single commodity, a group of commodities or all commodities is not applicable to policies in categories E, F and G. Consequently, using labels to analyse the composition of support requires attention to the scope of the data shown with respect to the PSE.

Labels may be expressed as sub-categories of the PSE categories as appropriate to reflect policy priorities or interests at a particular time. This may be done “formally” in the construction of the individual country spreadsheets or “informally” in the presentation of the results. For example, the label identifying whether the rate of payment is variable or fixed is currently used to create “formal” sub-categories of category E. On the other hand, the label identifying input constraints is used to present sub-categories of B1, B2 and B3 in the *2009 Agricultural Policies in OECD Countries* report. Similar sub-categories for these two or any other labels could potentially be applied to other PSE categories to which the labels are applicable.

### 3. The analytical potential of the PSE – theoretical considerations

In terms of its analytical potential to monitor policy developments, the system of categories identifies:

- The **transfer basis** for support: output (category A), input (category B), Area/Animal numbers/Receipts/Income (categories C, D and E), non-commodity criteria (category F);
- Whether the support is based on a **current** (categories A, B, C, F) or **non-current (historical or fixed)** basis (categories D and E);
- Whether **commodity production** is **required** (categories A, B, C and D) or **not** (category E and F).

Two of the labels (Table 2.1) extend the analytical potential of the categories by providing additional information directly related to the implementation criteria (the conditions under which the policy transfers are delivered to producers) covered by the categories.

- The label that identifies payment eligibility based on A/An/R/I provides further information on the **transfer basis** for support by specifying the four relevant bases of support for each policy measure in categories C, D and E. Taken together with the detailed categorisation, the label allows seven possible bases for policy transfers to be identified.
- The label that identifies payment eligibility based on commodity specificity provides further information on what type of **commodity** production is **required** in categories A, B, C and D, whether it is based on the production of a single commodity (SC), a group of commodities (GC) or is provided to all commodity (AC) production. Where production of a single commodity or group of commodities is required by the policy measure, those commodities are identified explicitly.

One of the labels provides additional information that complements the remaining implementation criteria used to define the categories.

- The label that identifies whether the *payment rate* for a policy measure is fixed or variable complements the information provided by the categories as to whether support is provided on a current or non-current basis. If the rate of payment (support per unit of output, input, area, animal number, etc.) is explicitly linked to changes in current prices received or paid by farmers, or current production/yield achieved or current income obtained, then the policy measure is labelled as variable, *i.e.* it is linked to the current market situation. If not, it is labelled as fixed in the sense that the rate of payment is determined by other factors. This does not mean that the rate of payment for a policy measure labelled as “fixed” cannot change over time. It can,<sup>2</sup> but the rate of payment does not vary from year to year based directly on what is currently happening on the farm. This label is applied to policy measures in categories A to E.

The other three labels provide additional information on implementation criteria that are distinct from that used for the categories. In terms of analytical potential, the labels identify:

- Whether the support *imposes limits* on either commodity production receiving the transfer (*e.g.* through production quotas or land-set aside requirements) or the value of transfers that can be received by the farmers through the specific policy measure (*e.g.* through a limit on the area or the number of animals eligible as the basis for payment). This label is applied to policy measures in categories A to F.
- Whether the support *requires constraints* on the use of inputs, specific production practices or various environmental or societal criteria (*e.g.* related to animal welfare). When the constraints, practices or criteria are considered as a basic requirement of good farming practice or relate to a regulation, the policy measures are labelled as “with mandatory” constraints. When the constraints, practices or criteria go beyond a basic requirement or general regulations, *e.g.* buffer field strips, extensive production methods or organic farming, they are labelled as “with voluntary constraints”. The voluntary label means that farmers can voluntarily choose to enter the programme to receive the transfer but compliance with the conditions is compulsory once the farmer has entered the programme. The voluntary label therefore refers to the fact that the policy measure requires compliance with constraints, practices or criteria that go beyond a basic requirement and the farmer voluntarily enters into an arrangement to receive the payment with these conditions. This label is applied to policy measures in categories A2 to E.
- Whether the support *prohibits production* of certain commodities as a condition for receiving the payment. A policy measure labelled as “with exceptions” indicates that there are certain commodities that the farmer cannot produce in order to be eligible for a payment, thus restricting the type of production that the farmer may wish to undertake. The label indicates that the conditions of the policy place a constraint upon certain production decisions. This label is applied only to policy measures in category E.

Having considered the implementation criteria identified by the PSE classification system, these can be compared with the characteristics of agricultural policy reform as agreed by OECD Agricultural Ministers in 1998<sup>3</sup> and reinforced by OECD analysis,

- 
2. Similarly there is nothing to prevent a policy measure being provided on a historical/fixed basis from changing that basis over time.
  3. The full text of the Ministerial Communiqué can be found in [www.oecd.org/agr/ministerial](http://www.oecd.org/agr/ministerial).

summarised most recently in OECD (2008b). Comparing characteristics helps to further identify the analytical potential of the classification system to monitor policy developments. It helps the judgement as to whether the change in policy characteristics as identified by the PSE classification system is moving the policy in the direction of reform. A reference point is needed if the analytical potential of the classification system is to be fully realised.

The general concept of agricultural policy reform involves a greater reliance on market signals to guide the allocation of resources. Three policy characteristics — decoupling, targeting and tailoring — are pertinent. “After agricultural support has been partially, or even fully, decoupled from production, additional gains in terms of effectiveness, economic efficiency and equity can be reaped by providing support in a form that is directly targeted to the specific objective and by tailoring the amount of expenditures to the problem at hand” (OECD, 2008b). Table 3.1 defines these characteristics and illustrates how they may be identified within the PSE categories and labels.

**Table 3.1. The PSE classification system and agricultural policy reform**

Illustrative examples

Policy characteristics associated with agricultural reform	Identification within the PSE classification system	
	Categories	Labels
<b>Decoupling</b> – reduces the impact of agricultural policies on production and trade <sup>1</sup>	Progress shown by a <b>decrease</b> in the proportion of support...	
	<ul style="list-style-type: none"> <li>based on output and variable inputs with no input constraint</li> <li>based on current rather than non-current conditions</li> <li>requiring commodity production</li> </ul>	<ul style="list-style-type: none"> <li>labelled as linked to single commodity production</li> <li>labelled as having variable payment rates</li> <li>labelled as having production exceptions</li> <li>labelled as having no production/payment limits</li> </ul>
<b>Targeting</b> – connects policies to specific outcomes using precise actions to well-defined groups or areas <sup>2</sup>	Progress shown by an <b>increase</b> in the proportion of support...	
	<ul style="list-style-type: none"> <li>based on non-commodity criteria shows direct link with non-commodity outputs, resource retirement, etc</li> </ul>	<ul style="list-style-type: none"> <li>labelled as having voluntary input constraints</li> <li>labelled as based on income/receipts</li> </ul>
<b>Tailoring</b> – provides payments no greater than necessary to achieve clearly identified outcomes <sup>2</sup>	Progress shown by an <b>increase</b> in the proportion of support...	
	<ul style="list-style-type: none"> <li>based on receipts</li> </ul>	<ul style="list-style-type: none"> <li>labelled as having production/payment limits<sup>3</sup></li> <li>labelled as having variable payment rates</li> </ul>

1. It is understood that all agricultural support measures have some impact on production decisions, but at various degrees (OECD, 2006).

2. The two characteristics — targeting and tailoring — are sometimes combined. For example, an OECD study on effective targeting of agricultural policies defined that “a policy is considered as targeted if it pursues specific outcomes set in policy objectives, identifying the most appropriate actions (including level and scope of intervention), and/or groups and/or areas, while minimising unintended transfers and negative spill-over effects” (OECD, 2007a). For the purposes of this analysis, they are best considered separately.

3. Rather weak link because the label also identifies those having production limits.

In general, the current PSE classification system has a far greater ability to identify the extent of decoupling that has taken place than to identify the other two characteristics, targeting and tailoring. The three features of the classification system identified as revealing the extent to which policy measures are targeted only pick up a proportion of those policy measures. The feature of the PSE classification system identifying tailoring is at best a weak link because it also includes those having production limits. However, the system is flexible and additional labels based implementation criteria could be introduced to reflect the targeting or tailoring dimension of policy measures.

#### 4. The analytical potential of the PSE – practical considerations to date

Before proceeding to consider in depth the analytical potential of the revised PSE classification system of categories and labels to monitor and evaluate policy measures, this section reviews briefly how it is already being used to do this in three recent reports: *Agricultural Policies in OECD Countries: Monitoring and Evaluation 2009* (OECD, 2009a), *An Overview of Risk-Related Policy Measures* (OECD, 2009b) and “Developments in Agri-environmental policies in OECD countries” (Chapter 2 in OECD 2009a).

In the annual report on agricultural policies in OECD countries, the composition of producer support is predominately presented and discussed in terms of the PSE categories. A standard estimate of support table shows the value of transfers in each first-order and detailed PSE category for two three-year averages (1986-88 and 2006-08) and the last three annual values. This is presented for each OECD country and for the OECD as a whole (Tables 1.3, 1.4 and 3.1, 4.1, 5.1, etc. in OECD, 2009a). The report also contains a table showing, over the same time and country dimensions, the composition of producer support by first-order category as a percentage share of the PSE value, *i.e.* category shares add to 100% (Table III.5).

In graphical form the composition of producer support by category is shown in six ways in OECD (2009a). It is presented graphically:

- as a percentage of gross farm receipts (*i.e.* the category contributions add up to the %PSE) on an annual basis over the period 1986-2008 for the OECD as a whole (Figure 1.6);
- as a percentage share of the PSE value on a two three-year average comparison basis for all countries (Figure 1.7);
- as a percentage of gross farm receipts on an annual basis for each country (Figures 3.2, 4.2, etc.);
- as a percentage of gross farm receipts on a single three-year average comparison basis for all countries (Figure 3.1<sup>4</sup>);
- as a percentage share of the PSE on a two three-year average comparison basis for all countries highlighting the two categories (categories E and F) identifying payments not requiring commodity production (Figure 1.10).

---

4. The same figure is repeated at the beginning of each country chapter except the specific country is highlighted in bold.

- as a percentage share of the PSE on a two three--year average comparison basis for all countries showing the most production and trade distorting categories – represented by the sum of PSE transfers based on output (category A) and payments based on variable input use with no constraints attached (policy measures in detailed category B1 labelled as without input constraints) (Figure 1.14).

In each of the first three cases, all seven first-order categories are shown. In the last three cases only some of the categories are displayed. In Figure 3.1 categories C and D are combined to give a total for transfer based on A/An/R/I where production is required. In Figures 1.10 and 1.1.4, the two extremes in terms of the potential production impact of the support are highlighted.

In terms of labels, far greater use is made of tables rather than graphs to present results although new figures are being developed each year as use and familiarity with the new classification grows. The standard estimate of support table produced for each country and the OECD as a whole presents some specific labels as additional sub-categories in addition to those based on receipt/income and area/animal numbers in category C and with fixed and variable rates in category E which are part of the standard classification. It shows the value of transfers from policy measures identified: with input constraints (both mandatory and voluntary) in categories B1, B2, B3 and C2; and with commodity exceptions in categories E1 and E2. It is important to recognise that the value of transfers shown for a particular label in these tables does not represent the total value of transfers with these labels in the PSE.

In this regard, the report does show the total value of transfers labelled as based on Single Commodities by country and for the OECD as a whole, broken down by commodity (Tables III.8 to III.21). It also shows the total value of transfers labelled A/An/R or I by category for each country and expresses this as a share of the PSE value (Tables III.36 to 3.47). Further, it details the total proportion of the PSE characterised by certain labels by country and for the OECD as a whole (Table III.6). This table shows the share of the PSE value with output and payment limits, with input constraints (both mandatory and voluntary), based on single commodities, and not requiring production – although this last policy characteristic is determined on the basis of categories (E and F) rather than labels.

The main label that is presented graphically is the SCT.<sup>5</sup> The value of SCT transfers for each of the standard set of commodities is presented as a per cent share of gross farm receipts for each commodity, *i.e.* the %SCT which shows the proportion of gross receipts received by that commodity that derive from transfers specifically for that commodity. It is displayed by commodity for the OECD as a whole for 1986-88 and 2006-08 (Figure 1.9), and for each country for 2006-08 (Figures 3.3, 4.3, etc.). These graphs are constructed to show the composition of SCT transfers by category (categories A1, A2 and other). New figures have been added to the 2009 report on *Agricultural Policies in OECD countries: Monitoring and Evaluation* that present, as a per cent of gross farm receipts on

5. The relative importance of the SCT label is also reflected in the fact that specific indicators of support are derived from this label, namely the Producer Single Commodity Transfers (Producer SCT) – the annual monetary value of gross transfers from consumers and taxpayers to agricultural producers, measures at the farm gate, arising from policies linked to the production of a single commodity such that the producer must produce the commodity in order to receive the payment. This nominal indicator is used to derive two ratio/percentage indicators – the share of SCT in total PSE and the percentage SCT.

an annual basis for each country, commodity specific support, *i.e.* showing the composition of transfers labelled as based on the production of single commodities, groups of commodities, all commodities, or other transfers to producers (Figures 3.4, 4.4, etc.). A series of graphs showing the contribution of transfers labelled as having input constraints has also been included (Figure 1.11). Using two three-year averages, these show the percentage share of such transfers in the PSE and the distribution of these transfers across the first-order categories measured in terms of the per cent of gross farm receipts to give an indication of the relative importance.

In *An Overview of Risk-Related Policy Measures* (OECD, 2009b), the revised PSE classification system is used to help identify risk-related policy measures within the PSE. However, because the classification system is based on implementation criteria rather than policy objectives this is neither an obvious nor a simple task. The implementation criteria that proved most helpful is the variable rate label which is used to identify policies with counter-cyclical features in four PSE categories: A2 (CO), C (PC), D (PHR) and E (PHNR). But this was not sufficient to capture all risk-related policy measures in the PSE, many of which were only found by a line-by-line examination of individual policies within the database. While some forms of risk-related policies were found under the same PSE category for all countries, *e.g.* extension services in category B3 (PIS), others were found in more than one PSE category, *e.g.* transfers to farmers through disaster relief policy measures were classified into three different PSE categories, B1 (PIV), B2 (PIF) and C (PC).

The revised PSE classification system is also used to identify agri-environmental **payments** in a special chapter in the 2009 *Agricultural Policies in OECD Countries: Monitoring and Evaluation* report (OECD, 2009a). The chapter considers the full range of policy measures addressing agri-environmental issues including regulatory requirements, environmental taxes and charges, tradable rights and quotas, community-based approaches and payments. The PSE database can only be used to identify agri-environmental payments because regulations, environmental taxes and charges and other approaches are not covered. However, information about the full range of agri-environmental policy measures, listed by country and environmental objectives, is available in the OECD's *Inventory of policies addressing environmental issues in agriculture* database ([www.oecd.org/tad/env/inventory](http://www.oecd.org/tad/env/inventory)).

The chapter reinforces the point that locating policy measures designed to achieve environmental objectives, through the PSE classification system is not straightforward, although it is probably easier in this case than for risk-related measures. A mixture of both categories and labels are used to identify agri-environmental payments. They are found in categories F1 (PNLT) and F2 (PNSO); and in categories B1 (PIV), B2 (PIF), B3 (PIS), C (PC) and D (PHR) where they are also labelled as being implemented with an input constraint, *i.e.* they require farmers to reduce the use of inputs, apply specific farming practices or meet specific criteria.<sup>6</sup> However, not all policy measures classified in these categories and with these labels are implemented for the purpose of achieving

---

6. In this report, payments to farmers subject to environmental cross-compliance and payments to less favoured areas are not included as agri-environmental payments. Discussion on which payments to less favoured areas can be considered agri-environmental payments is ongoing in the OECD in the context of the project on Inventory of policies addressing environmental issues in agriculture undertaken under the auspices of the Joint Working Party on Agriculture and the Environment.

environmental objectives. The classification system is helpful for identifying the general location, but again line-by-line consideration of each policy measure is necessary.

Having identified the relevant policy measures within the PSE database, the analysis of these policies is rather similar in both studies. Both show in graphical form the sum of transfers associated with the identified policy measures as a share of the PSE and as a share of total budgetary payments (PSE less MPS), and comment on changes in these shares over time and differences between countries. The risk-related study compares two 6-year averages (1992-97 and 2002-07) and the agri-environmental study shows the annual share over a 13-year period (1996 to 2008). Both studies also show and comment on the composition of the policy measures. While the agri-environmental study discusses the composition of transfers according to five PSE categories/label combinations, the risk-related study uses an alternative composition that specifically relates to the risk – risk reduction, *ex ante* risk mitigation/coping, etc.

## 5. The analytical potential of the PSE – further practical considerations

This section analyses the information contained in the PSE database from two perspectives: categories by label and country, and countries by category and label. While there will be some overlap in terms of the information provided, analysing the data from these different perspectives ensures that all dimensions of the database are properly considered. There will also be some overlap with the analysis discussed in the previous section, particularly regarding the information contained in the annual *Agricultural Policies in OECD Countries* report, but this is important for considering whether the most appropriate category/label combinations are being presented. The analysis covers annual data from 1986 through to 2007. This is to ensure that categories and labels used during the years outside the 1986-88 and 2005-07 periods as provided in the 2008 report are also considered. The analysis is carried out at the detailed/sub-category level with the following two exceptions. First, the two sub-categories of C and E are considered as labels rather than sub-categories. Second, sub-categories F1, F2 and F3 are not considered as such and category F is considered at the first-order level.

The data that is assembled has many possible permutations and combinations. There are in fact 514 possible category/label combinations, with 144 different label combinations possible for both categories C and D. The large number of possible category/label combinations makes analysis on a two-dimensional plane extremely difficult. However, there are by definition, no policy measures labelled as having eligibility for payment based on both animal numbers and for all commodities – which reduces the total number of possible category/label combinations by 24 (12 each for categories C and D). Further, there are some category/label combinations that are more important within the PSE composition. In 2006 and 2007 over half of the total PSE for OECD as a whole came from just two category/label combinations: Category A1 (MPS) with labels identifying no limit, variable payment rate and single commodity (40%); and Category E (PHNR) with labels identifying production/payment limits, fixed payment rates, with mandatory constraints, based on area and having production exceptions (12%).

### 5.1. Categories by label and country

Annex Tables 1 to 10 of Annex 2 shows for each PSE category, the proportion of transfers that has been assigned with each appropriate label by country and for the OECD as a whole. This provides information as to the relative use and importance of labels within and between PSE categories. The main findings are reported in Table 5.1.

Changes in the composition of support classified into a particular category as shown by labels can be easily graphed (Figure 2.1). This is because labels, when applicable, are assigned exhaustively within a particular category, making comparisons possible. Category C has been chosen in the example because it has the most number of label combinations present within any category, reflecting both the large number of label combinations theoretically possible and the large number of policies classified into this category. Of all the PSE categories, Category C has undergone perhaps the most significant changes in composition.

There are five sets of labels applicable in category C, with one of the variables chosen to represent each of the five on the axis of the radar diagram. Two of the labels have only two options: whether transfers have production/payment limits or if the payment rates are variable or fixed. In these two cases, choosing one of these variables for the axis means that the remaining percentage of transfers is identified with the other possible variable. For example, Figure 5.1 shows the percentage of transfers in category C having limits (L) and fixed (F) labels assigned to them. Subtracting this from 100% gives the percentage of transfers having no limits or variable rates of payments assigned to them.

The other three have more than two options. In these cases, great care needs to be taken in selecting the label (or combination of labels) chosen to interpret the results. For the label identifying the transfer basis of support, the figure shows the percentage of transfers labelled as based on either receipts or income (R/I), *i.e.* two labels have been combined. This combination makes sense because the two labels are closely related, both dealing with financial performance. The remainder represents the proportion of transfers labelled as based on either land or animal numbers, both dealing with factors of production. These four variables are often grouped into these two groups, and in fact is how the sub-categories of C are organised – C1 being income/receipts and C2 being area/animal numbers.

Similarly, for the label identifying input constraints, the figure shows the percentage of transfers labelled with either mandatory or voluntary input constraints (IC). In this case, the remainder is the share of transfers without input constraints. What the figure is unable to show is the proportion of those within a group, *e.g.* the share of transfers with mandatory as opposed to voluntary input constraints.

Finally, for the label identifying the commodity basis of support, the figure shows the percentage of transfers labelled as based on all commodities (AC). The remainder is therefore based on single or groups of commodities. These two have been grouped together because they are both far more specific than transfers eligible for all commodities.

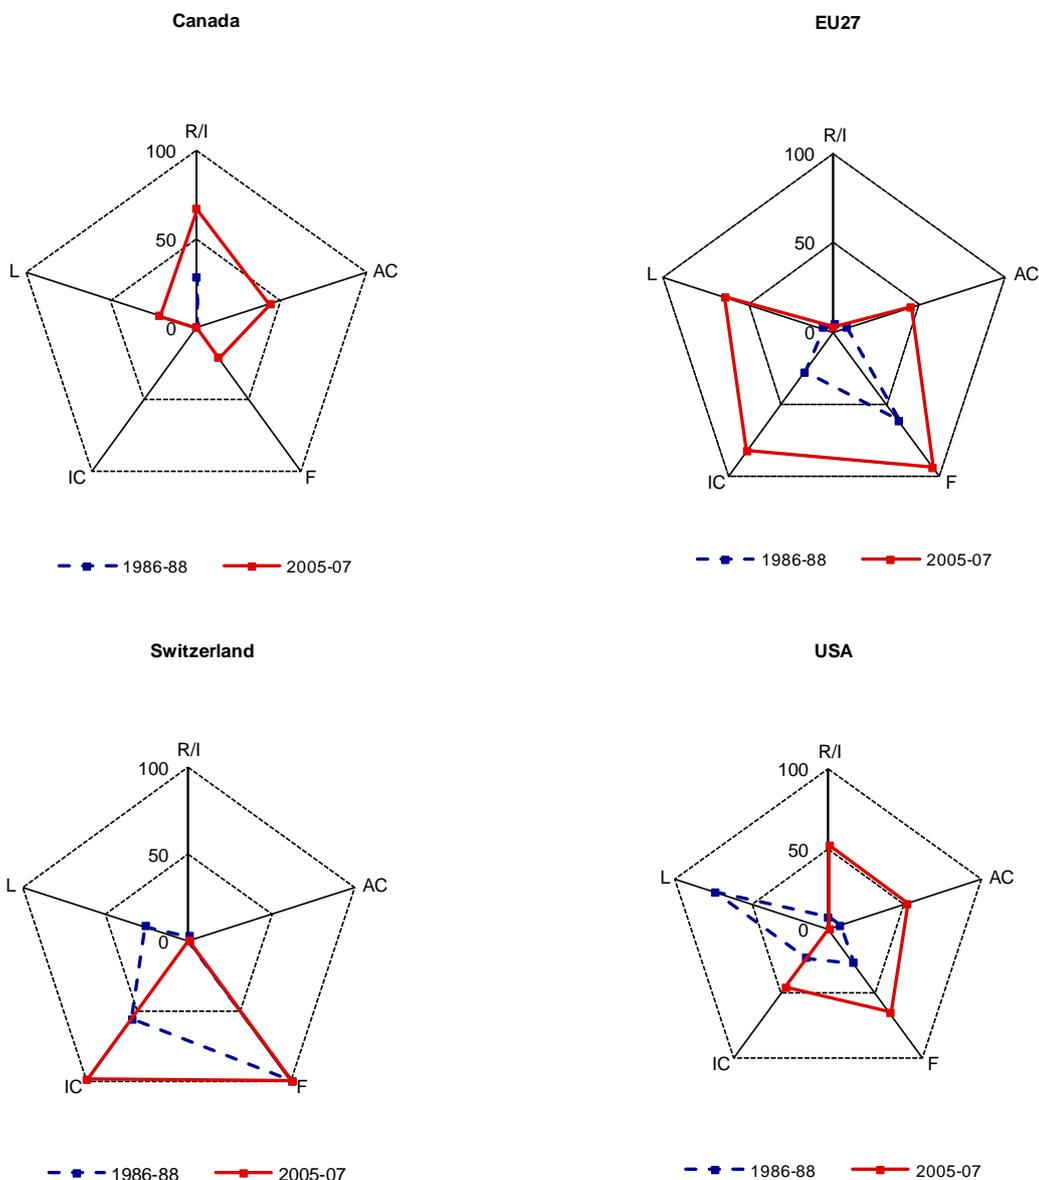

Table 5.1. The importance of labels within PSE categories

PSE category	Main findings
A1. MPS	<p>The only really difference between countries occurs in terms of whether production/payment <b>limits</b> are imposed or not. Australia, Iceland, Japan, Korea and New Zealand have never imposed limits: limits have always been imposed on all MPS transfers in Turkey and the United States. The share of MPS transfers with limits has increased in Canada but decreased in the EU and Switzerland.</p> <p>The only country to indicate fixed <b>payment rates</b> for MPS transfers is Canada: all others are variable.</p>
A2. PO	<p>In most countries there has been an increase in the proportion of transfers with production/payment <b>limits</b> except in Japan, Norway and the United States where the proportion without limits has increased. Variation exists between countries in terms of <b>payment rates</b>. In Iceland, Korea, Norway, Switzerland and Turkey payment rates have always been fixed. In Canada and the United States they have always been variable. There has been a move away from variable to fixed in the EU and Japan, and from fixed to variable in Mexico.</p> <p>In most countries there are no <b>input constraints</b>. The exceptions being the United States (which has always required mandatory constraints), the EU (where mandatory constraints have been introduced on some transfers) and Switzerland (where there has been a move away from voluntary constraints to no constraints).</p>
B1. PIV	<p>In all countries, the vast majority of these transfers are provided without production/payment <b>limits</b>. Only Mexico has shown any move to impose limits on these forms of support.</p> <p>They are generally provided at fixed <b>payment rates</b> except in Australia, Japan and Norway where all or most are provide at variable rates.</p> <p>They are almost always provided without <b>input constraints</b>. The exceptions being Switzerland and the United States where a small proportion have constraints imposed.</p> <p>In most countries the policy measures have always been available to all <b>commodities</b>. In Canada, the EU, Mexico and Norway there has been a noticeable shift in the proportion of payments going from groups of commodities to all commodities.</p>
B2. PIF	<p>In all countries except the United States, these transfers are provided without production/payment <b>limits</b>. In the United States limits are imposed on all transfers in this category.</p> <p>They are generally provided at fixed <b>payment rates</b> except in Australia and Switzerland where all or most are provided at variable rates. There has been a move away from variable to fixed rates in the EU, Norway and the United States.</p> <p>In most countries there are no <b>input constraints</b>. The exceptions being Canada (where programmes with voluntary constraints have been introduced), the EU and Korea (where mandatory constraints have been introduced on some transfers), and the United States (which has always required some form of constraints).</p> <p>In most countries PIF transfers are generally made available to all <b>commodities</b> with the exception of Iceland and Turkey where transfers are directed at either single or groups of commodities.</p>
B3. PIS	<p>In all countries except Canada and the United States, these transfers are provided without production/payment <b>limits</b>. In the United States limits are imposed on one-third of transfers in this category.</p> <p>Similarly in all countries except the United States, all transfers are provided at fixed <b>payment rates</b>. In the United States a small proportion of payments are based on variable rates.</p> <p>In almost all countries there are no <b>input constraints</b>. The exceptions being the EU and the United States where mandatory constraints have been introduced on some transfers.</p> <p>While most policy measures in this category are available to all <b>commodities</b>, a greater proportion (approx 25% at OECD level) of these transfers in this category have been made available to single or groups of commodities than in either B1 or B2. All countries with the exception of Canada provide some PIS transfers to single or groups of commodities, and all of it in the case of Norway and Turkey.</p>
C. PC	<p>In most countries no production/payment <b>limits</b> are established. A move to establish limits is observed in Canada, the EU and Japan, while in Switzerland and the United States payments are no longer provided with limits.</p> <p>Australia, Iceland, Norway and Switzerland have only used fixed <b>payment rates</b>. All others have used both fixed and variable payment rates. Over time there has been a move towards a greater proportion of transfers based on variable rates in the United States.</p>

PSE category	Main findings
C. PC (cont.)	<p>Transfers are provided without <b>constraints</b> in Australia, Canada, Mexico, New Zealand and Turkey, with no country providing all transfers with constraints. A greater proportion of transfers are being provided with constraints in the EU, Japan, Norway, Switzerland and the United States.</p> <p>Only New Zealand provides transfers in this category on the basis of all <b>commodities</b>. Iceland has only provided them to single commodities with Switzerland providing them primarily to groups of commodities. All the others have a combination. Over time there has been an increasing proportion of transfers provided to all commodities in Canada, the EU, Japan, Mexico, Norway and the United States.</p> <p>Countries generally use more than one of the variables <b>A/An/R/I</b> as the basis for transfers. Australia and New Zealand have only provided transfers on the basis of income, although an increasing proportion of transfers in Canada, Japan, Norway and the United States are being provided on the basis of either income or receipts. Transfers based on animal numbers have been mainly used in European countries, although this has become relatively less important compared to area in the EU but not in Norway or Switzerland.</p>
D. PHR	<p>In Australia, Mexico, New Zealand and Switzerland no production/payment <b>limits</b> are established. In contrast, limits are imposed on all transfers in Canada and Iceland. Norway has both.</p> <p>They are almost always provided at fixed <b>payment rates</b>. Only Canada has provided them with variable rates.</p> <p>In Australia, Canada and Iceland they are provided without <b>input constraints</b>. In Switzerland they all have mandatory constraints while in Mexico they all have voluntary constraints.</p> <p>Australia, Iceland, Mexico and Norway provide these transfers to single <b>commodities</b> while groups of commodities benefit in Canada, New Zealand and Switzerland. Only in Canada, Norway and Switzerland have a portion of these transfers been directed at all commodities.</p> <p>Countries generally use only one of the variables <b>A/An/R/I</b> as the basis for the transfer: Animal numbers are used by Iceland, Mexico and Switzerland; and Receipts or Income used by Australia, Canada and Norway, who as the exception, also uses area.</p>
E. PHNR	<p><b>Limits</b> are imposed on all transfers in the EU, Korea, Mexico, Turkey and the United States. In contrast, no limits are imposed on all transfers in Australia, Iceland and Switzerland. A small but increasing share of transfers has limits in Canada and Japan.</p> <p>The vast majority of transfers are provided on a fixed <b>payment rate</b>. Only Australia, Canada and the United States have used variable rates.</p> <p>The vast majority of countries provide these transfers without <b>input constraints</b>. In the EU and Switzerland they are always provided with mandatory constraints (cross-compliance), and most of the time in the United States.</p> <p>Countries generally use only one of the variables <b>A/An/R/I</b> as the basis for the transfer, with area being the most dominant: Area is used by the EU, Japan, Korea, Mexico, Switzerland, Turkey and the United States; Animal numbers by Iceland and to a limited degree Canada; and Receipts or Income by Australia and Canada (which had historically used area).</p> <p>The majority of transfers are provided with <b>exceptions</b>. Only Canada, Korea, Switzerland and Turkey have always provided without exceptions. All the others have implemented some, if not all, measures with exceptions. With the implementation of the 2003 reform, the EU subordinated certain payments to exceptions that are to be gradually eliminated.<sup>7</sup> In the United States, payments introduced in 1996 are provided with exceptions, but at the end of the review period, the share of payments without exceptions seems to have increased somewhat.</p>
F. PN	<p>The only label with the potential for differences to emerge between countries is whether a production/payment <b>limit</b> is imposed or not. All other labels are either not applicable or predetermined by definition (e.g. voluntary input constraint). Eight countries have had policy measures classified in this category over the period. In all cases, policy measures have been assigned the label as having no limits. However, the most important policy characteristic of interest regarding policy measures classified in this category concerns what non-commodity criteria being targeted by the policy measure, i.e. the difference between countries in terms of detailed categories F1, F2 and F3. Detailed categories rather than labels are of far more policy interest in this case.</p>

7. For the period 2005-07, the gradual reduction of the share of payments with exceptions was the result of the increasing amount of single payments made without exceptions in new member states and in those countries which opted for a dynamic implementation of the single payment scheme. In addition, the 2008 reform of the fruit and vegetable sector will result in the elimination of exceptions in 2011, when the implementation period will come to an end.

**Figure 5.1. Change in composition of category C by label for selected countries, 1986-88 and 2005-07**

Symbols: A/An – Area/Animal numbers; “AC” – All Commodities; “F” – Fixed payment rates; “IC” – with Input Constraints (both mandatory and voluntary); “L” – with production/payment Limits.

The label or groups of labels have also been chosen because a greater proportion of transfers assigned with these may well illustrate a movement towards the reform of agricultural policies as discussed in Table 3.1. The closer to the middle, the greater the proportion of transfers provided to single or groups of commodities, based on factors of production (land or animal numbers), paid on the basis of current market conditions, paid without limits and without input constraints. In contrast, the closer to the edge of the

diagram, the greater the proportion of transfers provided to all commodities, based on financial performance, paid at fixed rates, with limits imposed and constraints required.

In 1986-88, Canadian policy measures in category C were all without limits, without constraints, with variable payment rates and to single or groups of commodities, with the majority based on area/animal numbers. A similar situation existed in the United States except payment limits were imposed on the majority of transfers and some had fixed payment rates and input constraints. In the EU and Switzerland, input constraints and fixed payment rates were relatively more important.

Comparing 1986-88 with 2005-07 reveals some similarities and differences between countries in the composition of the C category. Starting at the top and moving in clockwise direction it is observed that Canada and United States base a largest proportion of transfers on income/receipts, while in the EU and Switzerland payments based on area/animal numbers remain dominant. Payments being provided on the basis of all commodities are increasing in Canada, the EU and United States, but remain based on single or groups of commodities in Switzerland. The proportion with fixed payments has increased in Canada, the EU and United States, and remained fixed in Switzerland. An increasing proportion of payments are now subject to input constraints in the EU, Switzerland and the United States, although these have not yet been imposed in Canada. Finally, in Canada and the EU, an increasing proportion is based on production/payment limits: these are not imposed in Switzerland or the United States.

## 5.2. *Countries by category and label*

The composition of support can also be considered at the country level, by considering the proportion of support classified into the various categories or assigned specific labels for specific countries or groups of countries. This provides information as to the relative use and importance of categories and labels within and between countries. It is the common approach to analysing the composition of support in the annual *Agricultural Policies in OECD Countries* report as detailed in Section 4.

Annex Tables 10 to 22 shows for each OECD country and for the OECD as a whole, the proportion of transfers that have been classified into categories and assigned with various labels for each year from 1986 to 2007. Again, all years are included rather than just the first and last three-year averages to show how the proportions may have changed in the intervening years. Changes in the composition of support over time are not straight-line changes from first to last. Sometimes policy measures are implemented in the intervening years that are classified into categories and/or assigned labels that are not represented in the first and last three-years. The transition path of policy reform can vary considerably between countries, even if their starting and end points are similar.

The top half of each table reports on the composition of producer support by category. As the annual *Agricultural Policies in OECD Countries* report presents the composition by specific category, this analysis focuses on the category groupings discussed in Section 3: the transfer basis for support (output, input, Area/Animal numbers/Receipts/Income and non-commodity criteria); whether the support is based on a current or a non-current (historical or fixed) basis; and whether commodity production is required or not. The sum of these is equal to 100%.

To reveal the interrelationship between the categories and the three labels discussed in Section 3, the top half of the table also includes the relevant labels. In terms of the transfer basis of support, the table separates out the total proportion going to A/An/R/I, as

determined by the sum of the proportions classified into categories C, D and E, into each of these separate variables. The label is a sub-set of this category grouping. In this case the sum of the labels equals the total proportion provided on the basis of A/An/R/I. For example, in Canada the 28% of producer support provided on the basis of A/An/R/I in 1986 is made up of 16% provided on the basis of area, 0.6% on animal numbers and 11.3% on receipts.

In terms of whether commodity production is required or not, the label that identifies payment eligibility based on commodity specificity provides further information as to what type of commodity production is required: single commodity (SC), a group of commodities (GC) or is provided to all commodity (AC) production. The label can be considered as a sub-set of this broad category grouping. In this case the sum of the labels SC, GC and AC is equal to the total proportion classified as requiring commodity production. For example, in Canada the 97.7% of producer support requiring commodity production in 1986 is made up of 71.5% provided requiring production of single commodities, 14% on the basis of groups of commodities and 12.2% to all commodities.

The situation is a little different with regard to the third label that complements the categories. The categories can be grouped depending on whether they are provided on a current or non-current basis. The payment rate variable complements this with information as to whether the payment rate is based on a variable (current) or fixed basis. However, rather than being a sub-set of a particular category grouping as the previous two labels are, both label possibilities can be applicable to both groupings. Consequently, the category grouping and labels can be combined to provide information as to the share of producer support based on a current basis with payment rates determined by current conditions; based on a current basis with fixed payment rates, etc. The fifth category/label mix represents support that is categorised as based on a current basis but the payment rate label is not applicable. In this case it is equivalent to the non-commodity category grouping, *i.e.* the value of transfers arising from policy measures in category F.

The bottom half of each table reports on the composition of producer support by label. The three labels used in conjunction with category groupings in the top half are repeated for completeness. While some of the labels in some of the countries indicate that 100% of producer support is assigned with this label, this reflects the specific situation in that country. Labels do not necessarily add to 100%, and in most cases they do not.

A comparison of the tables reveals the following general points regarding the relative use of categories and labels.

- There has been a greater use of the implementation criteria represented by categories and labels over time, *i.e.* the spread of policy transfers across the different categories and labels increases across the columns. This would be expected given the growing complexity of policies and the classification system does this.
- The three labels directly linked with the categories greatly improve the level of detail provided at the category level.
- Changes in the relative proportions are often driven by changes in MPS. This is generally the largest category of transfers, and with relatively little variation in label used between countries (previous section), changes in MPS have a significant bearing on changes within the three category groupings, and the production/payment limit, single commodity and variable rate of payment labels.

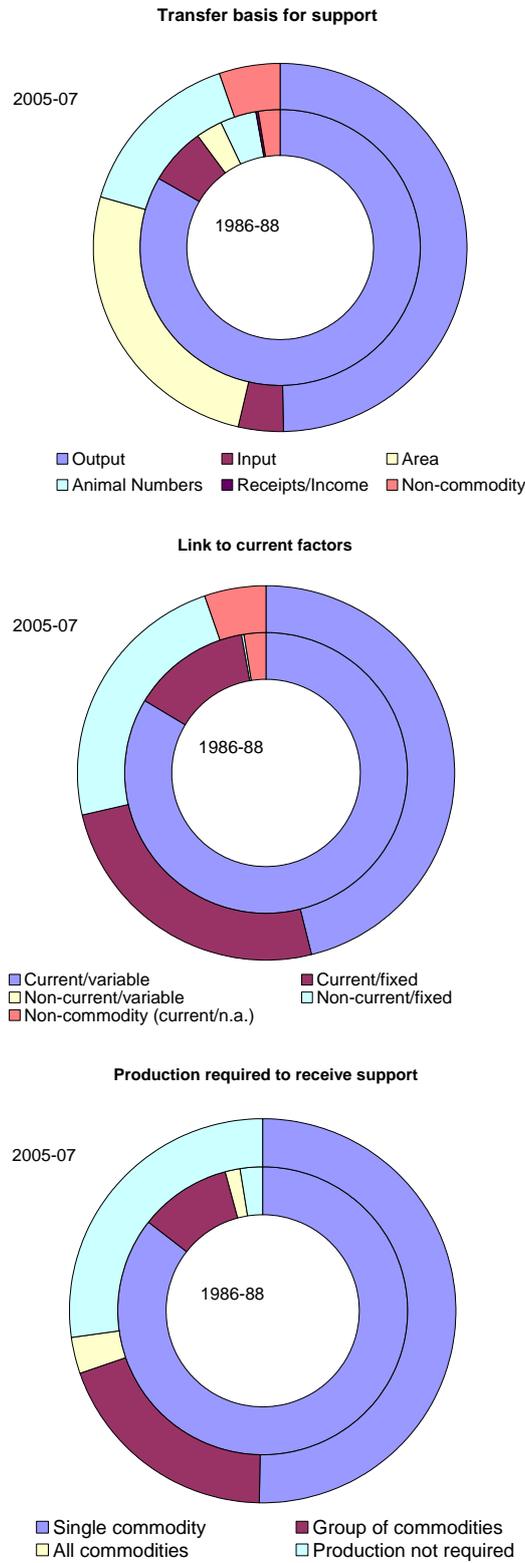

- In terms of the label identifying A/An/R or I as the basis of payment, while the variables do show the differences over time in policy approaches in some countries, particularly Canada, the label appears to more strongly identify differences between countries.
- Similarly, while the label identifying input constraints shows the development over time in policy approaches in countries such as the EU and Switzerland, it perhaps more strongly identifies differences between countries.

The three-category/label combinations show some of the major changes in agricultural policy. Figure 5.2 shows the changes in the three-category/label combinations for Switzerland. The inner circle shows the situation in 1986-88 while the outer circle shows the situation in 2005-07. Together they provide valuable insights into policy developments. In terms of the transfer basis of support, there has been a move from transfers based on output to those based on area and animal numbers, and an increase in the proportion of transfers provided to producers for non-commodity outputs. In terms of the link to current factors, there has been a reduction in the proportion of support provided on a current basis with variable payment rates. Almost 50% of support is now provided at fixed payment rates, with half paid on a non-current basis. There has been a move away from providing support to single commodities, although around one-half of producer support is directed to single commodities. There has been a significant increase in support provided on the basis of groups of commodities, or not requiring commodity production. Switzerland makes relatively little use of transfers based on all commodities as a lot of payments are for the group of livestock products.

The same graphics can be used to compare policy developments between countries. Figure 5.3 shows the change in the composition of producer support in the EU27 (outer circle) and United States (inner circle). The left-hand column of circles is the situation in 1986-88; the right-hand column is the situation in 2005-07. A general observation of the two columns indicates that the composition of producer support in the EU27 and United States is more similar in 2005-07 than it was in 1986-88.

In terms of the transfer basis of support, there has not been a significant shift in the composition of producer support in the United States except for a rise in transfers based on non-commodity outputs. By contrast, there has been a significant move in the EU away from support based on output to that based on area. In terms of the link with current factors, there has been a significant change in both the EU and United States, with a reduction in the proportion of support provided on a current basis at variable rates. Both have increased the proportion of support provided on a non-current basis at fixed rates. There are two main distinctions. First, the United States provides some transfers on a non-current basis that are linked to current market conditions while the EU does not, although this represents just 6.5% of producer support in 2005-07. Second, the United States provides a greater proportion of transfers for non-commodity outputs, 6.7% of producer support in 2005-07. In terms of the commodity basis of support, there has been a significant move away from transfers to single commodities in both the EU and United States. In both there has been a noticeable increase in support based on not requiring commodity production, with an increase in payments to all commodities in the EU.

**Figure 5.2. Switzerland: Change in composition of PSE by category/label combination 1986-88 and 2005-07**

**Figure 5.3. EU27 and United States: Change in composition of PSE by category/label combination, 1986-88 and 2005-07**

## 6. Conclusions and possible improvements

The analytical potential of the OECD support estimates has been greatly enhanced by the revised PSE classification system consisting of 12 PSE categories and six labels. Two limitations need to be noted. First, the classification system deals only with PSE policies, those providing transfers to farmers. Other policy measures, including transfers to general services and regulations, taxes and charges are not included. Second, the analysis is only as good as the work gone into ensuring that policy measures are classified into correct categories and assigned correct labels. The Secretariat needs to continuously ensure that policy measures are being treated consistently between countries, *i.e.* that policy measures with similar implementation characteristics are being categorised and labelled in a consistent manner.

The report identifies that greater use is being made of the policy characteristics identified by the categories and labels over time. The PSE classification system was redesigned to reflect the growing complexity of policies, and it appears to be capturing the changing nature of policy measures. Labels are most useful in categories C, D and E. In category F, only the detailed categories are relevant – the labels are either not applicable, predefined or all given the same label when the option is given. However, this is not really an issue given the amount of transfers involved.

In the process of establishing the revised PSE classification system, the PSE Focus Group identified label definitions as a potential weakness of the system, noting that the imprecise or generic nature of some of the proposed label definitions at that point in time undermined the analytical capacity of the system (OECD, 2007b). Before finally implementing the revised system, the Secretariat worked to improve the quality of the definitions. In terms of the labels, this report has found that the label identifying:

- **Commodity specificity** and whether support is based on **A/An/R or I** are relatively clear, precise and add a considerable amount of analytical value to the PSE categories. The label based on commodity specificity is particularly useful in analysing changes over time while the label based on A/An/R or I is more useful in showing up differences between countries.
- **Payment rates** also adds a significant dimension to the classification system. An important issue was raised as to whether the label set can be extended to give further information on how the payment rate is determined.
- **Input constraints** is generally good, although it is important to continually make explicit the distinction between the terms “mandatory” and “voluntary” as used in this label which is not that obvious. In the context of the work on agri-environmental policy, consideration is being given to how this label set can be developed to identify the nature of the constraints. This would appear to be a very useful development. There is, however, a practical issue about how far the label set can be extended and the amount of information that can be included within the database.
- **Production/payment limits** is rather weak in terms of analytical potential. This is primarily because it combines two quite different implementation criteria – whether there are production limitations and whether there is a limit on the payment – into one label alternative (with L). A simple first step would be to separate out these two implementation criteria into separate label alternatives within this label set, *i.e.* a label

set identifying if the policy measure has a production limit (PL), a transfer limit (TL) or no limit (NL) imposed. A complication may arise if a policy measure has both a production limit and a payment limit imposed. In this case, two different labels would need to be created, one for payment limits, the other for production limits.

- **Production exceptions** is rather limited in terms of its contribution to policy analysis because it is limited to just category E. Consideration could be given to extending the application of this label to other categories. A further weakness is that it gives no indication as to the extent of the restriction being placed on the farmer about what they cannot produce. It can vary quite considerably, from banning the farmer from producing just one particular commodity through to banning all commodities except one.

In addition to definitional questions, a few other problems have been identified during the preparation of this study. One issue is that the label system does not deal well with incremental changes to policy measures because the label applies for the whole period not for just a portion of the period. For example, if a payment limit or a mandatory input constraint is added to a particular policy measure that is already in existence there is no way of acknowledging it except creating a new policy line. To solve this problem, software other than Excel would have to be used.

Another issue relates to the use of the classification system to identify policies according to objectives. It should be stressed that the PSE classification system is based on implementation criteria, and not on policy objectives or on impact (on production, income, environment, etc.). However, it is possible for the PSE classification system to identify some objectives, e.g. it was possible to identify agri-environmental payments. Moreover, other work – using the PSE database – has addressed the issue of focus on policy objectives (e.g. the *Inventory of policies addressing environmental issues in agriculture*). While creating a new label containing a variety of objectives that are assigned to policy measures would appear to be both technically possible and further enhance the analytical capability of the classification system by increasing the transparency of policy measures (another characteristic of policy reform agreed to by OECD Ministers), there are a number of difficulties in doing so. A fundamental problem is that policy objectives are often vague and in many cases policy measures are not attributed to address explicit objectives. In some cases, stated objectives may differ from implicit objectives. There are practical questions about the feasibility of establishing a finite list of policy objectives that can be assigned, and attributing clearly defined objectives to each measure. Another issue is how to cope with multiple policy objectives. Policy measures are often implemented with more than one objective. One of the features of the classification system is that the labels are mutually exclusive – only one of the labels is applied. The label would have to be assigned to the most important objective or multiple labels would have to be used.

The PSE classification system is potentially most useful in analysing the extent to which support measures are more or less decoupled from production. A number of the possible linkages between implementation criteria and production are captured by the classification system. The system is less useful in helping to monitor and evaluate the extent to which policy measures are targeted and tailored to specific outcomes, as it was not designed to do this. But the system would allow labels identifying implementation criteria reflecting targeting could be added.

The 2009 edition of *Agricultural Policies in OECD Countries* presents some of the labels as sub-categories. Based on the analysis carried out in this paper, are these the most

important ones to identify from the perspective of highlighting differences between countries and over time?

For categories B1, B2 and B3 the value of transfers having input constraints (both mandatory and voluntary) are listed. As the categories deal with input use, the label identifying input constraints has perhaps a greater theoretical relevance than the other labels. Table 5.1 and Annex 2 Tables 3 to 5 indicate that for these three categories, most countries do not impose input constraints and that there has been relatively little change over time in the proportion of transfers having input constraints. Perhaps of more practical significance in terms of showing changes over time and differences between countries for these three categories would be to show the degree to which the transfers are provided to all commodities as opposed to single or groups of commodities.

For category C the value of transfers labelled as being based either on area/animal numbers or receipts/income aggregations, as well as the value of transfers with input constraints, are listed. Both of these labels appear to be the most relevant for this category. As this is the category in which most change in label composition has occurred any of the labels will show some differences between countries and over time.

For category E, the value of transfers labelled as based on fixed and variable rates are listed. This label has been chosen because of its theoretical relevance, *i.e.* as policy measures whose transfer basis is not linked to current parameters are assigned to this category, the label revealing the link between the rate of payment and current market conditions is relevant. Because of its relevance in the current policy context, this label is used as a sub-category in OECD annual reports on agricultural policies. In practice, the label reveals differences between countries rather than differences over time. A more relevant label/sub-category to consider changes over time within a country may well be the label showing whether production exceptions are a condition of receipt.

How helpful the PSE classification system is for policy analysis depends on the question being asked. It will answer some questions well – such as what is the share of transfers based on area? It will answer other questions not so well – such as what kinds of constraints are placed on farmers receiving this area payment? But it will not be able to answer all questions – such as what is the limit on the amount of payment a farmer can receive? While the PSE classification system provides a useful picture of some important differences in the way agricultural support policy is implemented over time and between countries, it is obviously limited by the pre-defined categories and labels. Further detailed analysis will require careful line-by-line consideration of the policy measures, which can be done using on-line information.

## Annex 1.

### Names and definitions of the PSE categories and PSE labels

#### PSE Categories

**A. Support based on commodity output:** transfers from consumers or taxpayers to agricultural producers arising from policy measures that raise the unit (per tonne) receipts received by farmers for a single commodity currently produced.

*A1. Market price support (MPS):* transfers from consumers and taxpayers to agricultural producers arising from policy measures that create a gap between domestic market prices and border prices of a specific agricultural commodity, measured at the farm gate level.

*A2. Payments based on output:* transfers from taxpayers to agricultural producers from policy measures based on current output of a specific agricultural commodity.

**B. Payments based on input use:** transfers from taxpayers to agricultural producers arising from policy measures based on on-farm use of inputs:

*B1. Variable input use:* transfers reducing the on-farm cost of a specific variable input or a mix of variable inputs.

*B2. Fixed capital formation:* transfers reducing the on-farm investment cost of farm buildings, equipment, plantations, irrigation, drainage and soil improvements.

*B3. On-farm services:* transfers reducing the cost of technical, accounting, commercial, sanitary and phyto-sanitary assistance, and training provided to individual farmers.

**C. Payments based on current A/An/R/I, production required:** transfers from taxpayers to agricultural producers arising from policy measures based on current area (A), animal numbers (An), receipts (R) or income (I), and requiring production.

*C1. Based on current receipts/income:* including transfers through policy measures based on receipts or income.

*C2. Based on current area/animal numbers:* including transfers through policy measures based on area or animal numbers.

**D. Payments based on non-current A/An/R/I, production required:** transfers from taxpayers to agricultural producers arising from policy measures based on non-current (*i.e.* historical or fixed) area, animal numbers, receipts or income, with current production of any commodity required.

**E. Payments based on non-current A/An/R/I, production not required:** transfers from taxpayers to agricultural producers arising from policy measures based on non-current

(i.e. historical or fixed) area, animal numbers, receipts or income, with current production of any commodity not required but optional.

**E1. Variable rates:** transfers using payment rates which vary with respect to levels of current output or input prices, or production/yields and/or area.

**E2. Fixed rates:** transfers using payment rates which do not vary with respect to these parameters.

**F. Payments based on non-commodity criteria:** transfers from taxpayers to agricultural producers arising from policy measures based on:

**F.1. Long-term resource retirement:** transfers for the long-term retirement of factors of production from commodity production. The payments in this sub-category are distinguished from those requiring short-term resource retirement, which are based on commodity production criteria.

**F.2. A specific non-commodity output:** transfers for the use of farm resources to produce specific non-commodity outputs of goods and services, which are not required by regulations.

**F.3. Other non-commodity criteria:** transfers provided equally to all farmers, such as a flat rate or lump sum payment.

**G. Miscellaneous payments:** transfers from taxpayers to farmers for which there is insufficient information to allocate them among the appropriate categories.

### PSE Labels

**With or without current commodity production limits and/or limits to payments (with/without L):** defines whether or not there is a specific limitation on current commodity production (output) associated with a policy providing transfers to agriculture and whether or not there are limits to payments in the form of limits to area or animal numbers eligible for these payments. Applied in categories A – F.

**With variable or fixed payment rates (with V/F rates):** a payment is defined as subject to a variable rate where the formula determining the level of payment is triggered by a change in price, yield, net revenue or income, or a change in production cost. Applied in categories A – E. For category E, these attributes are presented as additional sub-categories, not labels.

**With or without input constraints (with/without C):** defines whether or not there are specific requirements concerning farming practices related to the programme in terms of the reduction, replacement or withdrawal in the use of inputs, or a restriction of farming practices allowed. Applied in categories A–F.

Payments conditional on compliance with basic requirements that are mandatory (with mandatory);

Payments requiring specific practices going beyond basic requirements and voluntary (with voluntary).

**Based on area, animal numbers, receipts or income (Based on A/An/R/I):** defines the specific attribute (i.e. area, animal numbers, receipts or income) on which the payment is

based. Applied in categories C – E. For category C, these attributes are presented as additional sub-categories, nor labels.

**Based on a single commodity, a group of commodities or all commodities (Based on SC/GC/AC):** defines whether the payment is granted for production of a single commodity (*e.g.* wheat), a group of commodities (*e.g.* cereals) or all commodities. Applied in categories A – D.

**With or without commodity production exceptions (with/without E):** defines whether or not there are prohibitions upon the production of certain commodities as a condition of eligibility for payments based on non-current A/An/R/I of commodity(ies). Applied in category E.
