FOREWORD

This paper was presented to the Working Party on Communication Infrastructures and Services Policy in December 2008. The Working Party agreed to recommend the declassification of the document to the ICCP Committee. The ICCP Committee agreed to declassify the document at its meeting in March 2009.

The paper was prepared by Mr. Yasuhiro Otsuka of the OECD's Directorate for Science, Technology and Industry. It is published under the responsibility of the Secretary-General of the OECD.

MOBILE BROADBAND: PRICING AND SERVICES

MAIN POINTS

Although, the number of OECD countries that publish data on the number of mobile broadband subscribers is not large, growth is significant in markets where data are available. This paper provides an overview of prices, speeds and data caps of mobile broadband services. 99 and 58 operators in OECD countries are providing USB modem based and handset based services respectively with W-CDMA/CDMA-2000 technologies, while 4 are providing mobile broadband access with WiMAX technologies.

The data show that there is a wide range of subscriptions available but with considerable variation between and within countries. Differences are most pronounced in countries where mobile broadband is in its infancy. The number of new mobile terminals and USB modems on the market is stimulating much wider use of mobile broadband by consumers. Prices, as well as caps, need to be adjusted for the consumer market which is more price-sensitive.

In contrast to 2G services, growth of 3G has been stimulated by terminal manufacturers and application providers. To use the full functionality of terminals, Internet access is important as is having low prices. Pressure from terminal manufacturers as well as operators' need for new revenue sources is helping to open up the mobile broadband Internet market to new users.

The data indicate that for mobile broadband services via USB modem / PCMCIA card on W-CDMA and CDMA-2000 networks, the average data cap of the surveyed operators is 7.7 gigabytes per month and the maximum advertised speed exceeds 2 mbps for most operators. Prices for subscription with 5GB allowance per month vary from less than USD 20 to USD 60 with an average of USD 37.5 (PPP). Mobile broadband services are not yet sufficiently competitive, in most cases, with fixed offers in terms of price and general policies on data caps, although some substitution appears to be taking place in some markets with low prices.

For handset based mobile broadband services with W-CDMA and CDMA-2000 technologies, most providers offer services as add-ons for voice communications. Data allowances, which average 1.4GB per month, are typically less than connections via USB modems. However, services are more affordable and plans, with varying data allowance from 5MB up to 1GB and unlimited plans, are available at less than USD 10 (PPP) in 17 countries.

Many operators in OECD countries have indicated that they will provide mobile broadband services with WiMAX technologies. Although coverage of WiMAX-based services are still limited at the time this paper was drafted, services are typically competitive with W-CDMA and CDMA-2000 based services in terms of price and data allowance.

1. Introduction

Operators increasingly use the term “mobile broadband” to market high-speed mobile Internet connections to consumers. Subscriptions which allow access to the Internet outside of a subscriber’s home or office are available from nearly all mobile operators with W-CDMA and CDMA-2000 technologies. Many operators have also indicated that they will provide mobile broadband services with WiMAX technologies. However, the rapid growth of high-speed mobile access has led to differences of how “mobile broadband” is defined and reported. There is only a limited amount of comparative information to perform fact-based analysis on this important topic. This paper was prepared as an attempt to study the developments of mobile broadband and to provide comparative data to policy makers. It focuses mainly on service aspects of mobile broadband such as price, speed and monthly data allowances as of October 2008, as a way to examine the current status of mobile broadband services across OECD countries. The paper is aimed at complimenting work underway to identify the most appropriate methodology for comparing mobile broadband services across OECD member countries.

W-CDMA and CDMA-2000 based mobile services are available in 29 OECD countries although not always with complete geographic coverage. Operators are in the process of extending service coverage areas and updating technologies to allow for higher connection speeds. In most OECD countries there are still more 2G subscribers than 3G. However, in Japan, 3G subscribers account for 93.7 million out of 104.8 million total mobile subscribers, and 89.7 million mobile subscribers have an Internet subscription as well.¹ This figure dwarfs the number of (fixed) broadband connections: 29.3 million.²

A growing number of subscribers are accessing the Internet with mobile broadband technologies across the OECD. In contrast to 2G services, growth has been stimulated by terminal manufacturers and application providers in the 3G market. A primary example of this has been the rapid diffusion of Apple’s iPhone 3G which was available in 21 countries by July 2008 and is expected to be available in over 70 countries including most of the OECD by the end of 2008. Apple sold over 6 million handsets within 3 months globally and helped push 3G subscriptions, with unlimited data plans, to consumers.³ To use the full functionality of this terminal, Internet access is important as is having low prices. Pressure from terminal manufacturers as well as operators’ need for new revenue sources is helping to open up the broadband Internet market to mobile users.

With 2G mobile penetration surpassing 100% in most OECD countries, the opportunities for growth in the market are becoming limited and average revenue per user has been relatively stagnant so that mobile operators are looking to new growth areas. This is likely to come from upgrading existing 2G subscriptions to 3G.⁴ Mobile broadband, rather than voice minutes, will likely be the main growth area in the mobile market as more subscribers upgrade to 3G.⁵ Ofcom in the United Kingdom estimates data revenue (not including SMS) accounts for GBP 1.0 billion out of GBP 15.1 billion of total mobile retail revenue.⁶ Data from Vodafone shows the data revenue in Europe grew from GBP 1.3 billion to 1.8 billion in 2007 and that it is increasing even in countries where voice revenue is falling.⁷ Verizon Wireless reported that its wireless data revenue has increased from USD 2.2 billion in 2005 to USD 7.4 billion in 2007.⁸

Mobile broadband services with WiMAX technologies are available in a limited number of countries at this stage. One significant difference between W-CDMA/CDMA-2000 and WiMAX is that the latter was launched initially for data services, instead of voice.

The number of OECD countries that publish data on the number of mobile broadband subscribers, either as an independent figure or as a subset of overall broadband subscribers, is not large. Table 1 contains a few examples.

Table 1. Mobile broadband data published by NRAs

Country	Data	Frequency
Austria	Telekom Monitor	Q
Denmark	Telestatistik	BA
Finland	Market Review	BA
Ireland	Irish Communications Market	Q
Norway	Det norske ekommarkedet	Q
Portugal	UMTS and data services	Q
Sweden	Swedish Telecommunications Market	A
US	High-Speed Services for Internet Access	BA

Q=Quarterly BA=Biannually A=Annually

In markets where mobile broadband data is available growth is significant, although from a small base. For instance, in Finland the number of mobile broadband subscribers grew from 143 000 to 307 000 in the first half of 2008.⁹ Growth has been rapid as well in Portugal where subscribers grew 31.6% to 1.9 million in the same period.¹⁰ However, definitions of mobile broadband differ from country to country – some countries define it based on technologies and others by the speed of connection or by data allowance. Internationally comparative data for mobile broadband subscribers is not available yet and this makes fact-based analysis much more difficult.

2. Aspects of mobile broadband

Analysis of mobile broadband requires a definition which is widely adopted – such a definition is not yet available although work is underway in this area. A definition of mobile broadband services should not rely on specific technologies, connection types or devices used. It should be defined in a more general manner so as to allow the incorporation of newly developing services and the convergence of current services and plans. Many recent developments in the telecommunication sector are tied to converged services, which may not lend themselves well to a narrow categorisation. Some handsets allow connections not only via 3G technologies but via Wi-Fi and Bluetooth radio interfaces as well. Even without these converged devices, plans that package both ADSL and mobile broadband connections for instance, are already available.

Services and devices may converge in the future but there are significant differences for consumers in existing markets. For instance, W-CDMA/CDMA-2000 connections via USB modems are marketed differently than connections using handsets. The service packages have different prices and dedicated data volumes. For this reason the examination of W-CDMA/CDMA-2000 mobile subscriptions has been broken down into two categories (modems and handsets), to facilitate an examination of developments in each sub-market separately, including whether there is competition or convergence between the two.

2.1 Technologies

There are a number of technologies available for mobile broadband services, W-CDMA/CDMA-2000, mobile WiMAX, iBurst and XGP. Figure 1 shows the development of HSPA, CDMA2000 and mobile WiMAX and predictions for their growth through 2013. W-CDMA/CDMA-2000 technologies are widely deployed and some operators have announced their intention to begin the process of upgrading to a new high-speed technology LTE (Long Term Evolution) by 2010 when standardisation is expected to be complete. LTE's projected speeds would be much higher than current 3G networks are able to provide. Deployment of WiMAX is still limited, but many operators in OECD countries have revealed that they will provide mobile broadband services with WiMAX technologies.

This paper focuses on services with W-CDMA/CDMA-2000 and mobile WiMAX technologies, which are currently widely available or planned to be deployed in the coming years. However, services with each technology are discussed separately on the understanding that their deployment stage and

business models are quite different so far. W-CDMA/CDMA-2000 networks were typically deployed for voice communications, while WiMAX networks were initially intended for data communications. Fixed WiMAX technologies are widely deployed in OECD countries, but mobile services are available in only a few countries and their coverages are still limited.

Figure 1. Evolution of mobile broadband technologies

Source: 3G Americas EDGE, HSPA and LTE Broadband Innovation.

2.2 Connection types

There are several ways subscribers can connect to the Internet using a mobile broadband connection. First, subscribers can use a dedicated modem to access the network. These modems typically connect to the computer via a USB or PCMCIA interface.

Second, subscribers can connect their laptop to a mobile phone which then becomes a modem for Internet access. This is known as tethering.

Finally, subscribers can connect to the Internet directly using their mobile handset.

These three types of connections are widely available on W-CDMA/CDMA-2000 networks. Table 2 summarises typical features of each connection type. Many operators offer different plans based on the connection type. For instance, independent subscription plans specifically for data communications are offered with USB modems in most cases. Data services are marketed differently with handsets where they are often an add-on to a voice package.

Table 2. Typical features of mobile broadband by type of connection

	Via USB modem	Via mobile handset as a modem	Directly from mobile handset
Usage	Data	Data/Voice	Data/Voice
Interface	laptop	laptop	Mobile handset
- mobility	Low	Low	High
- functions (screens, keys, CPU, memory)	High	High	Low

There are views that mobile broadband should be narrowly defined as data-only subscriptions. One of the difficulties of such an approach is that the narrow definition would not include many key developments in the market which are tied to the bundling of voice and data services. A recent study by Ofcom helps quantify the importance of mobile broadband access via a handset.

Ofcom found that 31% of those who accessed the Internet away from home or work used their mobile phone, 23% used a mobile datacard or USB dongle and 20% connected their mobile phone to their laptops.¹¹ Taking into account only those who accessed daily, access via a mobile phone (11%) is almost twice as high as access with a mobile datacard or USB dongle (6%) and three times as high as access with a mobile phone tethered to a laptop (4%). Furthermore, boundaries between these categories may become obsolete in the future. Hybrid smartphones are emerging which can provide a direct Internet connection via an interface similar to a PC. The future may see these two categories move closer to each other.

There are a number of noteworthy trends in a number of mobile markets. First, the mobile network has been much more of a controlled environment than the PSTN or broadband networks. PSTN and broadband operators have little control over the equipment which subscribers attach to the network. Mobile networks are different and operators have more control over the services and hardware on their networks, although increasingly customers prefer to choose their own terminals.

Second, developments in fixed broadband have an effect on the mobile sector. Markets with lower-speed fixed line offers, particularly with data caps, may see mobile broadband operators enter the market as potential substitutes for fixed-line service. Other markets with high-speed fibre access may be more complementary to wireless service. This can be seen clearly in Japan where subscribers have the highest fixed-line speeds available over the fixed network and make little use of USB modems, despite the large number of 3G subscribers. Most of mobile Internet connections in Japan are with mobile handsets and modem-based 3G accounts for only 2.4 million out of a total of 89.7 million mobile Internet subscriptions.¹²

3. Mobile broadband with W-CDMA/CDMA-2000 technologies

This section examines the current situation of mobile broadband services which are offered on W-CDMA/CDMA-2000 networks. W-CDMA/CDMA-2000 networks are by far the most widely deployed mobile broadband networks. They are available in over 110 countries including 29 OECD members¹³ and users should theoretically be able to use the same devices across borders. This also benefits device manufacturers who can take advantage of scale economies from a larger market.

Mobile coverage in each country is also growing. Although the differences in method calculating coverage across countries make direct comparison difficult, some operators claim their 3G coverage attained 99%.¹⁴ Some operators have put forward plans to upgrade fixed copper networks with wireless alternatives in some areas as a way to improve the availability of broadband in sparsely populated areas.¹⁵ Coverage is expected to continue to grow as demand for high-speed service grows and operators work to fulfil coverage obligations which were tied to their licences.

3.1 *Mobile broadband services via USB modem / PCMCIA card on W-CDMA/CDMA-2000 network*

Table 2 in the appendix provides a listing of 3G mobile broadband plans that were available in October 2008. The following criteria were used to gather offers from operator's websites:

1. Access: Via a USB or PCMCIA card modem.
2. Speed: A potential speed of 256 kbps or higher.
3. Technologies: UMTS/HSDPA/HSPA or CDMA-2000 1x/EV-DO/Rev. A.
4. Fee structure: A minimum data allowance of 100MB or more per month.
5. Duration of Contract: 24 months where discounts for long-term commitment are available.¹⁶
6. Bundling: The offers compared are only those available on a stand-alone basis. Plans which provided bundled services are not taken into account.

The data collection covered 228 offers from 99 operators across the OECD. Considerable variations are evident among these plans, even within countries. Differences are most pronounced in countries where mobile broadband is still in its infancy.

Operators commonly offer multiple plans and differentiate them by monthly data allowances or maximum advertised speeds. Table 3 breaks down how operators differentiate among several plans. Plans which are differentiated by top speed are most commonly found in the Nordic countries.

Table 3. How mobile operators differentiate mobile broadband offers (number of operators)

Data allowance	Speed	Data allowance & speed	One plan only
55	8	11	25

Data allowances

Monthly data caps are typical for mobile broadband subscriptions. Data caps are more common on mobile broadband services than fixed broadband services which are typically unlimited in many countries.¹⁷ Highest monthly data allowances provided by operators range from 400MB to over 30GB per month with a distribution among operators as shown in Table 4.¹⁸ The average data cap of the surveyed operators is 7.7 gigabytes per month. There are 17 providers that have set their highest allowance at 10 GB, while 15 have set it at 5 GB. "Unlimited" data allowances are offered by 22 operators who do not provide an explicit ceiling or fair use limit.

Table 4. Data allowance per month (highest allowance provided by operators) (number of operators)

<1GB	1GB≤ <3GB	3GB≤ <10GB	10GB≤	unlimited	unknown
3	10	33	29	23	1

Consumers often do not know how much data traffic they consume and feel more comfortable with "unlimited" services. Some operators try to address this by providing guidance on their website regarding general data use in order for consumers to make more informed decisions. Table 5 is an example of such guidance from the operator 3 in the United Kingdom. According to their site, a 1 GB cap is enough for 1 hour of web surfing and 100 e-mail exchanges per day (total 834MB in 30 days).

Table 5. Data usage example

	(MB)
Web surfing (per hour)	25.4
E-mail	0.024
Instant messaging (per hour)	0.013
Document uploading/downloading	1.46
Photo uploading/downloading	0.98
Game software program	781.25
MP3 music file (4min)	7.81
Movie trailer (4min)	48.83

Source: 3 UK, www.three.co.uk/personal/products_services/mobile_broadband/usage_calculator.omp

One way to put the advertised caps in perspective is to compare them with measures of actual mobile broadband usage. The Portuguese regulator ANACOM publishes quarterly statistics of data volume associated with Internet access from UMTS networks. The statistics show that average usage per active user per month has increased by 25.3% from 0.91 GB in the 2nd quarter of 2007 to 1.14 GB in the same quarter of 2008.¹⁹ Average data volume per session has also increased significantly from 18.9 MB to 27.0 MB.

These figures include all types of connections regardless of whether they use handsets or modems. Usage from subscribers with dedicated modems is typically assumed to be larger than with handsets as suggested by the larger data caps for modem subscriptions. On this point, statistics from PTS in Sweden provide some insight.²⁰

PTS reports that the average traffic volume for mobile data services per active user per month increased by almost seven times in a year, to 37.4MB at the end of 2007. Although traffic volume by type of connection (modem or handset) is not measured, the number of active data subscribers with modems increased by over 300% in the same period. This rate is higher than that of mobile data subscribers in general (62%) and connections with dedicated modems now account for 6.2% of all active mobile data connections, up from 2.5% in the previous year. This increase in modem connections could help explain some of the growth in data usage over the period.

Another way to put mobile broadband into context is to compare it to fixed-line broadband. MIC Japan estimated average download traffic per (fixed) broadband subscriber as 52.0kbps (30.3kbps for download and 21.7kbps for upload) in May 2008. This is equivalent to 16.06 gigabytes of traffic each 30 days.²¹ This estimated value is the arithmetic average of the traffic of 29 million fixed broadband subscribers and FTTH connections accounted for 43% of the total subscribers. Of the 99 mobile broadband operators surveyed 6 provided plans with data caps which could accommodate this volume.

Breaching the data limit and maximum prices

Once users surpass the data limit for the month they are subject to two possibilities, depending on their operator. In the first case the operator allows the subscriber to continue using the connection but charges an additional fee for incremental traffic until the next billing cycle. 138 of the 228 plans fall into this category. The additional charges vary significantly across providers and can quickly cost much more than the original bundled allowance. Alternatively, operators limit the connection speed for the remainder of the month once the subscriber has used their data cap.²²

Speeds

Some operators offer plans with several connection speeds and Table 6 summarises the maximum speed offered by each provider. The table indicates that the maximum advertised speed exceeds 2 mbps for most operators. 29 operators advertise speeds of 7.2 mbps and another 20 advertise speeds of 3.6 mbps.

Table 6. Maximum speed offered by operators (number of operators)

1mbps≤ <2mbps	2mbps≤ <3.6mbps	3.6mbps≤ <7.2mbps	7.2mbps	unknown
6	16	23	29	25

Currently, 85 operators in twenty-nine OECD countries are providing services with W-CDMA networks.²³ Its upgraded versions, HSDPA and HSUPA, are also available from 82 and 31 operators respectively. The earliest adoption of W-CDMA was in Japan by NTT DoCoMo in 2001 and the rollouts took place through the rest of the OECD between 2003 and 2005. HSDPA technology, which first appeared in 2005, was deployed between 2006 and 2007.

Figure 2. Deployment of W-CDMA, HSDPA and HSUPA technologies in OECD countries

Source: OECD, 3G Americas Global UMTS and HSPA operator status.

Another 3G radio interface, CDMA-2000, is adopted by 23 operators. There are 22 operators who have upgraded to EV-DO and 17 who have taken the further step to EV-DO Revision A. CDMA services in 450MHz band are rapidly expanding especially in Nordic and East European countries.²⁴

Figure 3. Deployment of CDMA-2000 1x, EV-DO and Rev. A technologies in OECD countries

Source: OECD, CDMA Development Group.

As is the case with fixed broadband, advertised speeds often overstate the true speed of connections by citing a theoretical maximum. A study over a period of 10 weeks in 140 locations in the United Kingdom found that average download speeds for mobile broadband services vary from 683 kbps to 1.2 mbps.²⁵ There are a number of providers, however, who have chosen to advertise based on realistic speeds instead of theoretical maximum speeds.

Table 7. Typical times to receive a file on the mobile broadband network

	Mobile Broadband with typical 7.2 mbps technology	Mobile Broadband with typical 1.8 mbps technology
20 minute video (150MB)	10 minutes	25 minutes
Large presentation (5MB)	20 seconds	50 seconds
Large photograph (2MB)	8 seconds	20 seconds
Word document (250Kb)	1 second	3 seconds

Prices

This section examines the price of mobile broadband services via a modem. Comparisons are grouped by data caps rather than advertised speeds. This allows for a much more reliable comparison among similar plans. All prices are shown in USD PPP in this section.

The first group of offers are subscriptions with 1 GB data caps. Prices range from less than USD 9 to over USD 70 with an average of USD 34.1 per month. Plans are available for USD 10 per month in Australia and Sweden (and in Austria a plan with 3GB allowance is available for as low as USD 10).

Figure 4. Price ranges for plans with 1GB data allowance

The next group of offers consists of plans with up to 5 GB of data usage each month. Prices vary from less than USD 20 to USD 60. The average is USD 37.5 and plans are available for approximately USD 20 in Sweden, Poland, Italy, Luxembourg and the United Kingdom (and plans with higher allowances are available for USD 20 in Austria and Denmark).

Figure 5. Price ranges for plans with 5GB data allowance

The next subset of plans looks at data caps up to 10 GB per month. Prices range from USD 16.5 to USD 78.6 with average of USD 40.5. Plans at around USD 20 are available in Ireland and Denmark (and in Austria a plan with 15 GB of monthly traffic is available for USD 20).

Figure 6. Price ranges for plans with 10GB data allowance

* Once the data limit is reached the user is offered unlimited data allowance at 128 kbps download speed. Furthermore, users have unlimited free Internet access at hundreds of WiFi hot-spots deployed by Telefonica in hotels, airports, railway stations, convention centres and public payphones of the main Spanish cities.

The final group of plans looks at offers without data caps. Prices for a monthly subscription are as low as USD 20 to over USD 80 with an average of USD 33.7²⁶ – Finland, Sweden, Luxembourg and Denmark have plans with prices at around USD 20 for plans without any data caps.

Figure 7. Price ranges for plans with “unlimited” data allowance

If users exceed their bit cap they often have to pay a set price per additional megabyte of traffic. Table 8 provides a summary of the excess data charges. The price of an additional megabyte of traffic ranges from USD 0.006 to over USD 10.

Table 8. Excess data charges for an additional MB of usage (USD (PPP): number of plans)

<0.01	0.01≤ <0.03	0.03≤ <0.1	0.1≤ <0.3	0.3≤ <1	1≤
5	18	41	42	22	16

Some plans have tiered allowance steps instead of a single allowance and for some plans the monthly fee would be reduced if usage does not exceed a certain volume.²⁷ Other plans adopt a metered rate with a price ceiling (where traffic beyond that point incurs no additional charges).²⁸

Another key pricing issue is the charges for international roaming. Using a data connection abroad is much more expensive than at home.

A European Regulator's Group report shows that the average retail price for data roaming is declining but is still as high as EUR 5.4 per MB for non-group (non-affiliated) companies and EUR 2.1 for group companies as of the end of 1st quarter 2008.²⁹ Charges for international roaming are generally high outside of the EU area as well.³⁰ Some operators offer packages which provide international roaming and these prices are highly discounted.³¹

Prepaid and metered rate plans

Prepaid plans are not common in the fixed broadband market, where "always-on" is taken for granted. However, some operators offer prepaid mobile broadband plans in addition to monthly subscriptions. Most prepaid plans offer a certain volume of data allowance that is valid for a fixed period, while other plans set an allowance by time, instead of data volume.³² Some others provide mobile broadband connection simply at a metered rate. In countries where high-speed fixed broadband is widely available both at home and the workplace, pre-paid or metered plans can be suitable for occasional use.

Devices

Some operators now offer mini-notebooks and modems packaged together.³³ These types of offers may help promote more mobile broadband use.³⁴ A consortium of PC and microchip manufacturers aims to boost mobile broadband by pre-installing modems into PCs.³⁵

Usage restriction

All the plans shown in Table 2 of the appendix allow users to send/receive e-mails and Internet browsing. Some operators make it clear that certain applications are not allowed on their networks and these applications include audio/video streaming, Voice-over-IP, P2P file sharing and online games.³⁶ However, many operators do not publish their policy on usage restrictions.

3.2 Possibilities for fixed mobile broadband substitution

Is mobile broadband a substitute for fixed-line broadband? Typically mobile broadband is inferior to fixed broadband in terms of price, data allowances and speed, as is shown in Table 9.

Table 9. Comparison of typical broadband services

	Price	Data allowance	Speed	Mobility
Mobile broadband	higher	lower	lower	mobility
Fixed broadband	lower	higher	higher	n/a

However, in some countries, mobile network operators provide very attractive plans in terms of price and speed. In Austria, for example, mobile broadband connections with a data allowance of 3GB are

available at EUR 9 and 15 GB at EUR 20.³⁷ The prices are fairly competitive with plans offered by ADSL service providers, such as the incumbent Telekom Austria, assuming subscribers do not go over the allotted data caps. Telekom Austria offers ADSL plans for EUR 39.9 for 2 mbps and EUR 59.9 for 4 mbps both without data caps.³⁸

The lower priced mobile broadband prices are having an impact in Austria. Mobile broadband subscriptions (defined as mobile contracts with an allowance of 250MB or more per month) have grown significantly from 216 000 at the end of 2006 to 665 000 at the end of 1st quarter 2008 and now account for 28.2% of the total for high-speed connections.³⁹ Figure 8 shows net growth of mobile and fixed broadband in every quarter.

Figure 8. Net growth of mobile and fixed broadband subscribers in Austria

Source: OECD, RTR, Austria Telekom Monitor.

Mobile broadband plans are attractively priced in Ireland and the United Kingdom as well. Irish operators added more mobile broadband subscribers between 2007 and 2008 than fixed broadband.⁴⁰ In the United Kingdom, the number of mobile broadband modem subscriptions increased by more than 510 000 between February and June 2008.⁴¹

There appears to be some substitution taking place in certain OECD markets but not others. In other markets growth is a function of the demand for mobility and data access.

3.3 *Mobile broadband services via handset with W-CDMA/CDMA-2000 technologies*

In contrast to mobile broadband services via USB modem / PCMCIA card, which are typically provided as independent services, mobile broadband services via handset are bundled with voice, either as *i*) add-ons to mobile voice contract or *ii*) a package that allows both voice and data communications.

Package plans are typically found in France and Italy, where all W-CDMA operators provide such bundled plans, but are available in other countries like Austria, the United Kingdom and the United States as well. Some operators make such plans available for as little as EUR 5 per month⁴², but others bundle

internet access services only with plans for heavy users. Although packages are not so widely found across OECD countries so far, they could be available more broadly with the development of demand, harnessed by growing penetration of networks, handsets and contents.

More providers offer mobile broadband services via handsets as add-ons for voice communications. Table 3 in the Appendix shows these services available in October 2008, which match the following criteria. 88 plans by 58 operators were found. Most operators, 42 out of 58, provide only one plan, in contrast with services via USB modem / PCMCIA card, where several plans, typically with different data allowances, are available from each operator. This characteristic of the service is seemingly related to the other two characteristics, namely small data allowances and lower speed, or less information provided on access speed.

1. Access: directly from handset (some of them allow tethering to laptops as well).
2. Speed: A potential speed of 256 kbps or higher.
3. Technologies: UMTS/HSDPA/HSPA or CDMA-2000 1x/EV-DO/Rev. A.
4. Fee structure: A minimum data allowance of 100MB or more per month (plans with less data allowance are also included if they are not offered by an operator).
5. Duration of contract: 24 months where discounts for long-term commitment are available.
6. Bundling: The offers compared are only those available as add-ons to mobile voice contract. Packages that allow both voice and data communications are not taken into account.

Data allowance

Data allowances for mobile broadband services via handsets are obviously lower, with an average of 1.4GB per month, than those of services via USB modem / PCMCIA card (average 7.7GB per month). Table 10 shows the distribution of the highest allowances provided by operators. Out of 40 operators with a certain amount of data allowance, 17 set it at lower than 500MB, which enables around 20 hours of web surfing according to the guidance in Table 5.

Table 10. Data allowance per month (highest allowance provided by operators) (number of operators)

<1GB	1GB≤ <3GB	3GB≤ <10GB	10GB≤	unlimited	unknown
24	9	5	2	15	3

Speed

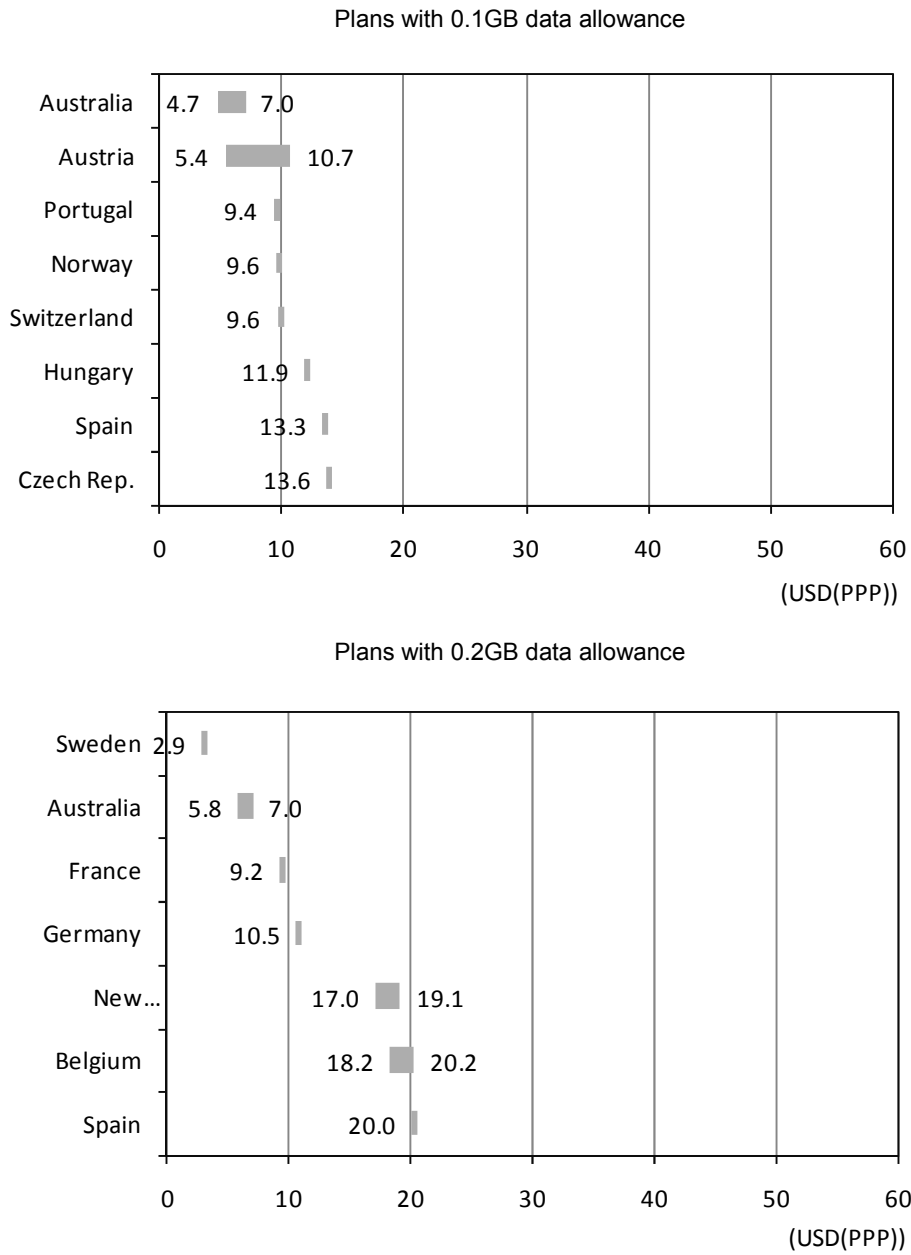

Only limited numbers of providers provide information on download / upload speed. Of those, some set the speed lower than for services via USB modem / PCMCIA card. A few providers offer several plans with various speeds.⁴³

Price

With smaller data allowance, services via handset are typically more affordable. In 17 countries, services are available at less than USD 10 (PPP), with allowances ranging from 5MB to 1GB or unlimited.

Figure 9 shows price ranges in each country for plans with certain amounts of data allowance, namely 0.1, 0.2, 0.5GB and with “unlimited” allowance.

Figure 9. Price ranges for plans with 0.1, 0.2, 0.5GB and “unlimited” allowance

Plans with 0.5GB data allowance

Plans with "unlimited" data allowance

4. Mobile broadband with WiMAX technologies

Another technology that provides mobile broadband is WiMAX. Fixed WiMAX, standardised as IEEE 802.16-2004, has been playing a key role in the field of fixed wireless broadband access and in 2005 IEEE added features to the standard so as to support mobility. In addition to mobility, this technology, called IEEE 802.16e-2005 or mobile WiMAX, supports features that increase spectrum efficiency as well.

Many operators in OECD countries have indicated that they would provide services with mobile WiMAX technology and have already acquired the spectrum necessary for operation. For instance, Clearwire, which has service operations in the United States and several other countries, holds spectrum licences that cover the entire country in Germany, Poland and Spain.⁴⁴ UQ Communications, Japan, has a nationwide licence on 2.5GHz band and is expected to launch its service in February 2009.⁴⁵ However,

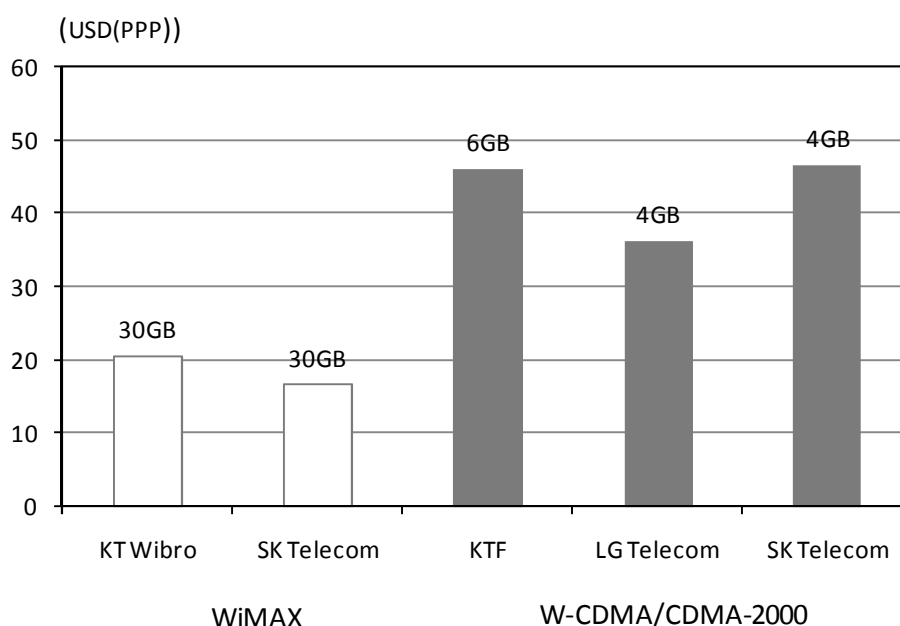

deployment has been delayed and in France, where licences for 3.5GHz band were issued in June 2006, ARCEP found that only 526 sites had been deployed instead of 3 564 set as an obligation as of June 2008.⁴⁶

This section examines 6 plans offered by 4 operators in Korea and the United States, which match the following criteria:

1. Access: Via a USB or PCMCIA card modem.
2. Speed: A potential speed of 256 kbps or higher.
3. Technologies: WiMAX or affiliated technologies.
4. Fee structure: A minimum data allowance of 100MB or more per month.
5. Duration of Contract: 24 months where discounts for long-term commitment are available.
6. Bundling: The offers compared are only those available on a stand-alone basis. Plans which provided bundled services are not taken into account.

In Korea KT launched mobile WiMAX, commonly called WiBro in the country, in June 2006, and coverage was expanded to all of metropolitan Seoul and selected universities in Gyunggi Province in April 2007.⁴⁷ KT's report shows that it provides connections at an average speed of 1mbps and has over 170 000 WiBro subscribers as of September 2008.⁴⁸ Figure 10 shows the price of WiMAX and W-CDMA/CDMA-2000 plans with the largest data allowance by each operator. WiMAX plans are attractively priced as low as USD 16.6 (PPP) for 30GB data allowance per month. They offer 5 times the big data volume, at less than half the price of W-CDMA/CDMA-2000 plans.

Figure 10. Comparison of monthly charges for WiMAX and W-CDMA/CDMA-2000 plans in Korea

In the United States, several operators are providing fixed wireless connections with pre-WiMAX and WiMAX technologies. Clearwire, which launched its operation in 2004 and has its pre-WiMAX networks covering an estimated 13.6 million people in 46 markets in the United States, released PC cards which greatly enhance users' mobility. The company is expected to deploy mobile WiMAX services in the second half of 2008 and migrate existing networks to mobile WiMAX technologies.⁴⁹ XOHM, a business division of telecom operator Sprint Nextel, launched its mobile WiMAX network in Baltimore in

September 2008 and claimed the average downlink speed would be 2-4 mbps.⁵⁰ It offers several plans, and connections at home (USD 35 per month) are priced cheaper than plans that allow connection anywhere covered by the network (USD 45).⁵¹ Clearwire and Sprint Nextel combined their WiMAX businesses into a new company, also named Clearwire, on 28 November 2008.⁵² The company plans to cover up to 140 million people in 36 months.⁵³ Figure 11 shows monthly charges for WiMAX and W-CDMA/CDMA-2000 services in the United States. WiMax Plans are slightly cheaper than W-CDMA/CDMA-2000 connections but the gap is not as large as in Korea.

Figure 11. Comparison of monthly charges for WiMAX and W-CDMA/CDMA-2000 plans in the United States

GLOSSARY

3G	Third-generation Mobile Network
ADSL	Asymmetric Digital Subscriber Line
CDMA	Code Division Multiple Access
EDGE	Enhanced Data Rates for GSM Evolution
EV-DO	Evolution Data Optimized
FTTH	Fiber-to-the-home
HSDPA	High-Speed Downlink Packet Access
HSPA	High-Speed Packet Access
HSUPA	High-Speed Uplink Packet Access
LTE	Long-Term Evolution
PCMCIA	Personal Computer Memory Card International Association
PPP	Purchasing Power Parity
PSTN	Public Switched Telephone Network
SMS	Short Message Service
UMB	Ultra Mobile Broadband
UMTS	Universal Mobile Telecommunications System
USB	Universal Serial Bus
W-CDMA	Wideband Code Division Multiple Access
WiBro	Wireless Broadband
WiMAX	Worldwide Interoperability for Microwave Access
XGP	eXtended Global Platform

APPENDIX

Table 1. Deployment of mobile broadband technologies in OECD countries

	XOHM	On-the-Go		45.0	45.0		

Note: Data were collected between 20 and 31 October 2008 from operators' websites based on following criteria:

1. Access: Via a USB or PCMCIA card modem
2. Speed: A maximum potential speed of 256 kbps or more
3. Technologies: WiMAX or affiliated technologies
4. Fee structure: A minimum data allowance of 100MB or more per month
5. Duration of contract: 24 months where discounts for long term commitment are available
6. Discounts: Any discounted offers for bundled services are not included

Source: OECD, operators' websites.

Table 5. PPP and exchange rate in national currency units per USD (September 2008)

Country	PPP	Exchange rate
Australia	1.71	1.22
Austria	0.93	0.70
Belgium	0.99	0.70
Canada	1.26	1.06
Czech Republic	17.38	17.04
Denmark	9.51	5.20
Finland	1.14	0.70
France	0.98	0.70
Germany	0.95	0.70
Greece	0.84	0.70
Hungary	167.75	167.75
Iceland	135.92	91.22
Ireland	1.21	0.70
Italy	0.96	0.70
Japan	130.10	106.64
Korea	965.10	1135.41
Luxembourg	0.95	0.70
Mexico	7.99	10.65
Netherlands	0.94	0.70
New Zealand	1.77	1.48
Norway	10.35	5.69
Poland	2.37	2.35
Portugal	0.79	0.70
Slovak Republic	20.68	21.10
Spain	0.87	0.70
Sweden	10.14	6.67
Switzerland	1.88	1.11
Turkey	1.20	1.23
United Kingdom	0.71	0.56
United States	1.00	1.00

www.teliasonera.com/press/pressreleases/item.page?prs_itemId=319988.

16 In some countries, the maximum tie-up period is regulated to be less than 24 months. For instance, tie-up period cannot exceed 6 months in Denmark. Section 13 of the Executive Order no. 714 of June 26 2008 on provision of electronic communications networks and communications services
www.retsinformation.dk/Forms/R0710.aspx?id=120508.

17 *OECD Broadband Statistics* (October 2008). All the surveyed plans in 10 countries are without data caps.
www.oecd.org/dataoecd/22/46/39575020.xls.

18 It should be noted that some providers do not include "on-net content" as part of the customers' data cap and this effectively increases the usage data.

25 Vodafone, United Kingdom, www.vodafone.com/start/media_relations/news/local_press_releases/uk_press_releases/2007/independent_trials.html.

26 Operators in some countries offer several plans with "unlimited" data allowance, which differ in maximum speeds. For instance, Elisa of Finland offers 4 plans with all "unlimited" data allowance, but with maximum speeds ranging from 384 kbps to 2 mbps. All these plans are included to calculate the average.

27 For instance, Rogers Canada offers Flex Rate Plan which consists of 5 tiers of allowance (0.5, 1, 2, 3, 5GB). Users would move automatically to a higher tier if usage exceeds the data allowance.
www.rogers.com/web/content/wireless-plans/iphone_card_plans.

28 NTT DoCoMo's Teigaku (Flat rate) Data Plan HIGH SPEED consists of 3 tiers. Up to 0.5 million packets (equivalent to 64 MB) is charged at a fixed price of JPY 3 465 (or USD 26.6 (PPP)), then prices move to a measured rate up until JPY 5 985 (or USD 46.0 (PPP)), and beyond this point no more additional fee would be charged. (ISP fees are charged in addition to this amount.)
