

The number of computerised tomography (CT) scanners and magnetic resonance imaging (MRI) units can be used to measure the diffusion of modern medical technology and, more specifically, diagnostic techniques based on medical imaging. Both of these technologies are used to diagnose a wide range of disorders.

### Technology improves diagnosis...

Modern technology provides better diagnosis, helps in selecting better treatment and enhances quality of life by avoiding the need for certain operations. Increasingly precise imaging now provides better evidence of deep or very small lesions that cannot be identified by clinical examination alone. It can also detect early signs of cancer, greatly improving the prognosis. CT scanners can detect morphological anomalies. They provide anatomical images of bones and organs. MRI units visualise details of specific tissues which are less well analysed by CT scanners. They offer the added advantage of not exposing patients to ionising radiation.

### ... but high costs are a limiting factor

To improve patient monitoring, radiologists often use a combination of the techniques available. These scanners are partly substitutable and partly complementary. Both are expensive but the cost of an MRI unit (some USD 1.9 million) is markedly higher than that of a CT scanner (from USD 600 000 to USD 1 million).

### Availability varies widely

Figures for 2004 show significant disparities in the diffusion of diagnostic techniques. Japan has far more CT scanners and MRI units per capita than other OECD countries (Figure 34.1). The United States, Korea and Belgium also have far more CT scanners than the OECD average, although far fewer than Japan. The United States and several European countries (Iceland, Switzerland, Austria, Finland and Italy) also have a relatively high number of MRI units per capita. Mexico and Poland, on the other hand, have few of either device. In both the Slovak and the Czech Republic, the number of MRI units is particularly low. The United Kingdom and Hungary have very few CT scanners.

### Significant regional variations

Turkey, at the bottom of the list for the diffusion of diagnostic technology, also suffers from a very uneven spread of such equipment across the country (Figure 34.2). And while Italy is above average for both types of equipment, it is having difficulty ensuring even access to them throughout the country. The number of CT scanners in parts of southern Italy is much higher than the national average, threefold in Campania, which has fewer MRI units, and 1.5 times more in Molise, which also has more MRI units. At the other end of the scale, the Trento area has no equipment of either type. The fact that healthcare provision is organised on a regional basis may explain these disparities, given the cost of such equipment.

#### Definition

Number of magnetic resonance imaging (MRI) units and computerised tomography (CT) scanners used in radiology to scan a cross-sectional plane of all or part of the body and to produce an image generated by computer synthesis of x-ray transmission data.

## 34.1. National diffusion of advanced diagnostic equipment, 2004

## 34.2. Regional variations in the number of MRI units and CT scanners, 2004

Percentage of OECD (10) average, 2004 (TL2)

## Regional distribution of medical imaging technologies by type of region

The regions best equipped with medical imaging units are usually those in which the population lives primarily in urban areas. In a majority of OECD countries for which such information is available, the number of MRI units and CT scanners per capita is positively correlated with the proportion of the regional population living in urban areas (Figure 34.6 and 34.7). Canada and Italy are the only countries where the number of medical imaging units is positively correlated with the proportion of the regional population living in rural areas.

These patterns, however, do not provide a full picture of the accessibility of medical technologies. While the number of MRI units and CT scanners per capita is a measure of the resources available in regions, their physical accessibility depends on the geographical distance from patients. In fact, a region may have a high number of MRI units and CT scanners per capita but accessibility may be low if they are located far from its inhabitants. Additional indicators – such as the number of tests and the time of utilisation – would be necessary in order to measure the actual accessibility of these technologies at the regional level.

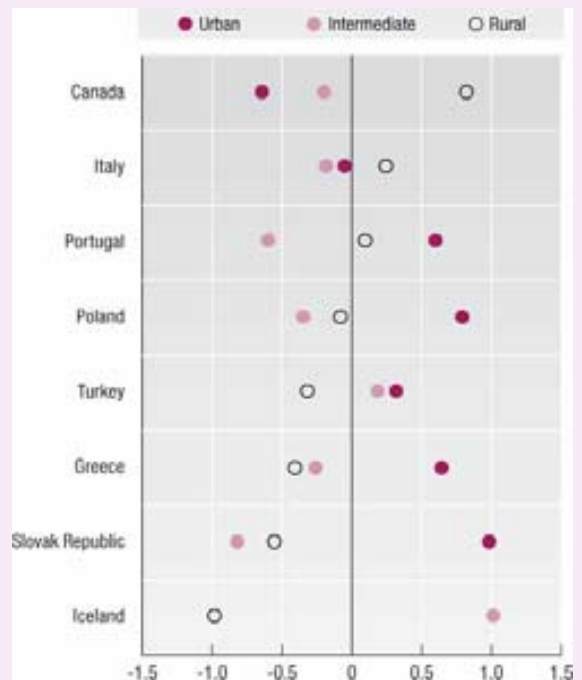

### 34.6. Correlation between the number of MRI units per inhabitant and the distribution of population by type of region

Spearman correlation coefficient, 2004 (TL2)

### 34.7. Correlation between the number of CT scanners per inhabitant and the distribution of population by type of region

Spearman correlation coefficient, 2004 (TL2)

## **I. REGIONS AS ACTORS OF NATIONAL GROWTH**

1. GEOGRAPHIC CONCENTRATION OF POPULATION
2. GEOGRAPHIC CONCENTRATION OF THE ELDERLY POPULATION
3. GEOGRAPHIC CONCENTRATION OF GDP
4. REGIONAL CONTRIBUTIONS TO GROWTH IN NATIONAL GDP
5. GEOGRAPHIC CONCENTRATION OF INDUSTRIES
6. REGIONAL CONTRIBUTIONS TO CHANGES IN EMPLOYMENT
7. GEOGRAPHIC CONCENTRATION OF PATENTS

## Table of Contents

<b>Executive Summary</b> .....	7
<b>Symbols and abbreviations</b> .....	11
<b>I. Regions as Actors of National Growth</b>	
1. <b>Geographic concentration of population</b> .....	14
2. <b>Geographic concentration of the elderly population</b> .....	20
3. <b>Geographic concentration of GDP</b> .....	26
4. <b>Regional contributions to growth in national GDP</b> .....	32
5. <b>Geographic concentration of industries</b> .....	38
6. <b>Regional contributions to changes in employment</b> .....	44
7. <b>Geographic concentration of patents</b> .....	50
<b>II. Making the Best of Local Assets</b>	
8. <b>Regional disparities in GDP per capita</b> .....	58
9. <b>Regional disparities in labour productivity</b> .....	64
10. <b>Regional disparities in specialisation</b> .....	70
11. <b>Regional disparities in tertiary education attainment</b> .....	76
12. <b>Regional disparities in unemployment rates</b> .....	82
13. <b>Regional disparities in participation rates</b> .....	88
<b>The Key Drivers of Regional Growth</b>	
14. <b>The factors behind regional performance</b> .....	96

16. <b>National factors and regional performances</b> .....	102
17. <b>Regional factors: GDP per capita and population</b> .....	106
18. <b>Regional factors: productivity and specialisation</b> .....	110
19. <b>Regional factors: employment, participation and ageing</b> .....	114
<b>III. Competing on the Basis of Regional Well-being</b>	
20. <b>Accessibility: distance from the closest urban centre</b> .....	120
21. <b>Education: student enrolments in tertiary education</b> .....	124
22. <b>Voter turnout in national elections</b> .....	128
23. <b>Safety: reported crimes against property</b> .....	132
24. <b>Safety: reported murders</b> .....	136
25. <b>Home ownership</b> .....	140
26. <b>Environment: private vehicle ownership</b> .....	144
27. <b>Environment: municipal waste</b> .....	148

## IV. Regional Focus on Health

28. Health: age-adjusted mortality rate .....	154
29. Health status: premature mortality .....	160
30. Health status: incidence of cancer .....	166
31. Health resources: number of physicians .....	172
32. Health resources: density of practising nurses .....	178
33. Health resources: hospital beds .....	182
34. Health resources: medical technology .....	188
35. Non-medical determinants of health: prevalence of smoking .....	194
36. Non-medical determinants of health: prevalence of obesity .....	198
