FILES IN THE DATABASE

The PISA international database consists of six data files¹: four with student responses, one with school responses and one with parent responses. All are provided in text (or ASCII format) with the corresponding SAS® and SPSS® control files.

Student files

Student performance and questionnaire data file (this file can be found on the PISA website www.pisa.oecd.org).

For each student who participated in the assessment, the following information is available:

- Identification variables for the country, school and student;
- The student responses to the two questionnaires, *i.e.*, the student questionnaire and the international option information communication technology (ICT) questionnaire;
- The indices derived from each student's responses to the original questions in the questionnaires;
- The students' performance scores in mathematics, reading, science, the three scales of science and embedded attitude scores in interest and support (five plausible values for each domain);
- The student weight variable and 80 Fay's replicates for the computation of the sampling variance estimates;
- Two weight factors to compute normalised (replicate) weights for multi-level analysis, one for countries and one for subnational entities;
- Three sampling related variables: the randomised final variance stratum, the final variance unit and the original explicit strata, mostly labeled by country;
- Some variables that come from the cognitive test: test language, effort variables and three science items that were internationally deleted because of students' misconceptions;
- Database version with the date of the release.

Two types of indices are provided in the student questionnaire files. The first set is based on a transformation of one variable or on a combination of the information included in two or more variables. Twenty-five indices are included in the database from this first type. The second set is the result of a Rasch scaling and consists of weighted likelihood estimate indices. Twenty-three indices from the student questionnaire and 4 indices from the international option on information communication technology questionnaire are included in the database from this second type. The index for socio-economic status (ESCS) is derived as factor scores from a Principal Component Analysis and is also included in the database. For a full description of the indices and how to interpret them see Chapter 16.

For each domain, *i.e.* mathematics, reading and science, and for each scale in science, *i.e.* *identifying scientific issues*, *explaining phenomena scientifically* and *using scientific evidence*, a set of five plausible values (transformed to the PISA scale) are provided.

The metrics of the various scales are established so that in the year that the scale is first established the OECD student mean score is 500 and the pooled OECD standard deviation is 100. The reading scale was established in 2000, the mathematics scale in 2003 and the science scale in 2006. When establishing the scale the data is weighted to ensure that each OECD country is given equal weight.

In the case of science, the scale that was established in 2006, the average of the five plausible values means for the 30 equally weighted participating OECD countries has been set at 500 and the average of the five plausible values standard deviations has been set at 100. Note that it follows that the means and

variances of each of the five plausible values are not exactly 500 and 100. The same transformation was applied to the three science sub-scales.

Reading plausible values were mapped to the PISA 2000 scale and mathematics plausible values were mapped to the PISA 2003 scale. See chapter 12 for details of these mappings.

The variable *W_FSTUWT* is the final student weight. The sum of the weights constitutes an estimate of the size of the target population, *i.e.* the number of 15-year-old students in grade 7 or above in that country attending school. When analysing weighted data at the international level, large countries have a greater contribution to the results than small countries. This weighting is used for the OECD total in the tables of the international report for the first results from PISA 2006 (OECD, 2007). To weight all countries equally for a summary statistic, the OECD average is computed and reported. The OECD average is computed as follows. First, the statistic of interest is computed for each OECD country using the final student weights. Second, the mean of the country statistics is computed and reported as the OECD average.²

For a full description of the weighting methodology and the calculation of the weights, see Chapter 8). How to use weights in analysis of the database is described in detail in the PISA 2003 Data Analysis Manual for SPSS® or SAS® users (OECD, 2005), which is available through www.pisa.oecd.org. The data analysis manual also explains the theory behind sampling, plausible values and replication methodology and how to compute standard errors in case of two-stage, stratified sampling designs.

All student cognitive files can be found on the PISA website: www.pisa.oecd.org.

For each student who participated in the assessment, the following information is available:

- Identification variables for the country, school and student;
- Test booklet identification;
- The student responses to the cognitive and attitude items. When original responses consist of multiple digits (complex multiple choice or open ended items), the multiple digits were recoded into single digit variables for use in scaling software). A “T” was added to the end of the recoded single digit variable names. The original response variables have been added at the end of the single digit, unscored file (without a T at the end of the variable name and the Q replaced by an R, see further below). The scored data file only has one single digit variable per item with scores instead of response categories.
- Test language;
- Effort self report;
- Database version with the date of the release.

The PISA items are organised into units. Each unit consists of a stimulus (consisting of a piece of text or related texts, pictures or graphs) followed by one or more questions. A unit is identified by a short label and by a long label. The units’ short labels consist of four characters and form the first part of the variable names in the data files. The first character is R, M or S for reading, mathematics or science, respectively. The next three characters indicate the unit within the domain. For example, M155 is a mathematics unit. The item names (usually seven- or eight-digits) represent questions within a unit and are used as variable names (in the current example the item names within the unit are M155Q01, M155Q02T, M155Q03T and M155Q04T). Thus items within a unit have the same initial four characters plus a question number. Responses that needed to be recoded into single digit variables have a “T” at the end of the variable name. The original multiple digit responses have been added to the end of the unscored, single digit file without a “T” in the name and with the “Q” replaced by a “R” (for example, the variable M155Q02T is a recoded item with the corresponding original responses in M155R02 at the end of the file). The full variable label

indicates the domain the unit belongs to, the PISA cycle in which the item was first used, the full name of the unit and the question number. For example, the variable label for M155Q01 is “MATH - P2000 POPULATION PYRAMIDS (Q01)”.

In all both files, the cognitive items are sorted by domain and alphabetically by item name within domain. This means that the mathematics items appear at the beginning of the file, followed by the reading items and then the science items. The embedded attitude items have been placed after the cognitive items, first the embedded interest items followed by the embedded support items. Within domains, units with smaller numeric identification appear before those with larger identification, and within each unit, the first question will precede the second, and so on.

School file

The school questionnaire data file (this file can be found on the PISA website www.pisa.oecd.org).

For each school that participated in the assessment, the following information is available:

- The identification variables for the country and school;
- The school responses on the school questionnaire;
- The school indices derived from the original questions in the school questionnaire;
- The school weight;
- Explicit strata with national labels; and
- Database version with the date of the release.

The school file contains the original variables collected through the school context questionnaire. In addition, two types of indices are provided in the school questionnaire files. The first set is based on a transformation of one variable or on a combination of two or more variables. The database includes 14 indices from this first type. The second set is the result of a Rasch scaling and consists of weighted likelihood estimate indices. Four indices are included in the database from this second type. For a full description of the indices and how to interpret them see Chapter 16. The school weight (W_FSCHWT) is the trimmed school-base weight adjusted for non-response (see also Chapter 8).

Although the student samples were drawn from within a sample of schools, the school sample was designed to optimise the resulting sample of students, rather than to give an optimal sample of schools. For this reason, it is always preferable to analyse the school-level variables as attributes of students, rather than as elements in their own right (Gonzalez and Kennedy, 2003). Following this recommendation one would not estimate the percentages of private schools versus public schools, for example, but rather the percentages of students attending a private school or public schools. From a practical point of view, this means that the school data should be merged with the student data file prior to analysis.

For general information about analysis of school data see the PISA 2003 Data Analysis Manual for SPSS® or SAS® users (OECD, 2005), also available through www.pisa.oecd.org.

Parent file

The parent questionnaire file (this file can be found on the PISA website: www.pisa.oecd.org). The following information is available:

- The identification variables for the country, school and student;
- The parents' responses on the parent questionnaire;

- The parent indices derived from the original questions in the parent questionnaire; and
- Database version with the date of the release.

The parent file contains the original variables collected through the parent context questionnaire as a national option instrument. In addition, two types of indices are provided in the parent questionnaire file. The first set is based on a transformation of one variable or on a combination of two or more variables. The database includes six indices from this first type. The second set is the result of a Rasch scaling and consists of weighted likelihood estimate indices. Eleven indices are included in the database from this second type. For a detailed description of the indices and how to interpret them see Chapter 9.

Due to the high parent non-response in most countries, caution is needed when analysing this data. Non-response is not random. When using the final student weights from the student file, the weights of valid students in the analysis do not sum up to the population size of parents of PISA eligible students. A weight adjustment is not provided in the database.

RECORDS IN THE DATABASE

Records included in the database

Student and parent files

- All PISA students who attended test (assessment) sessions.
- PISA students who only attended the questionnaire session are included if they provided at least one response to the student questionnaire and the father's or the mother's occupation is known from the student or the parent questionnaire.

School file

- All participating schools – that is, any school where at least 25% of the sampled eligible, non-excluded students were assessed – have a record in the school-level international database, regardless of whether the school returned the school questionnaire.

Records excluded from the database

Student and parent file

- Additional data collected by countries as part of national or international options.
- Sampled students who were reported as not eligible, students who were no longer at school, students who were excluded for physical, mental or linguistic reasons, and students who were absent on the testing day.
- Students who refused to participate in the assessment sessions.
- Students from schools where less than 25% of the sampled and eligible, non-excluded students participated.

School file

- Additional data collected by countries as part of national or international options.
- Schools where fewer than 25% of the sampled eligible, non-excluded students participated in the testing sessions.

REPRESENTING MISSING DATA

The coding of the data distinguishes between four different types of missing data:

- Item level non-response: 9 for a one-digit variable, 99 for a two-digit variable, 999 for a three-digit variable, and so on. Missing codes are shown in the codebooks. This missing code is used if the student or school principal was expected to answer a question, but no response was actually provided.

- Multiple or invalid responses: 8 for a one-digit variable, 98 for a two-digit variable, 998 for a three-digit variable, and so on. For the multiple-choice items code 8 is used when the student selected more than one alternative answer.
- Not-administered: 7 for a one-digit variable, 97 for a two-digit variables, 997 for a three-digit variable, and so on. Generally this code is used for cognitive and questionnaire items that were not administered to the students and for items that were deleted after assessment because of misprints or translation errors.
- Not reached items: all consecutive missing values clustered at the end of test session were replaced by the non-reached code, “r”, except for the first value of the missing series, which is coded as item level non-response.

HOW ARE STUDENTS AND SCHOOLS IDENTIFIED?

The student identification from the student and parent files consists of three variables, which together form a unique identifier for each student:

- A country identification variable labelled *COUNTRY*. The country codes used in PISA are the ISO numerical three-digit country codes.
- A school identification variable labelled *SCHOOLID*.
- A student identification variable labelled *STIDSTD*.

A fourth variable has been included to differentiate adjudicated sub-national entities within countries. This variable (*SUBNATIO*) is used for four countries as follows:

- *Belgium*. The value “05601” is assigned to the Flemish region, “05602” to the French region and “05603” to the German region of Belgium
- *Italy*. The value “38001” is assigned to Provincia Autonoma of Bolzano, “38002” to Provincia Basilicata, “38003” to Provincia Campania, “38004” to Provincia Emilia Romagna, “38005” to Provincia Friuli Venezia Giulia, “38006” to Provincia Liguria, “38007” to Provincia Lombardia, “38008” to Provincia Piemonte, “38009” to Provincia Puglia, “38010” to Provincia Sardegna, “38011” to Provincia Sicilia, “38012” to Provincia Trento, “38013” to Provincia Veneto, “38014” to the rest of Italy.
- *Spain*. The value “72401” is assigned to Andalusia, “72402” to Aragon, “72403” to Asturias, “72406” to Cantabria, “72407” to Castile and Leon, “72409” to Catalonia, “72411” to Galicia, “72412” to La Rioja, “72415” to Navarre, “72416” to Basque Country, and
- *United Kingdom*. The value “82610” is assigned to England, Northern Ireland and Wales and the value “82620” is assigned to Scotland.

A fifth variable is added to make the identification of countries more convenient. The variable *CNT* uses the ISO 3166-1 ALPHA-3 classification, which is based on alphabetical characters rather than numeric characters (for example, for Sweden has *COUNTRY*=752 and *CNT*=SWE).

A sixth variable (*STRATUM*) is also included to differentiate sampling strata. Value labels are provided in the control files to indicate the population defined by each stratum.³

The school identification consists of two variables, which together form a unique identifier for each school:

- The country identification variable labelled *COUNTRY*. The country codes used in PISA are the ISO numerical three-digit country codes.
- The school identification variable labelled *SCHOOLID*.

FURTHER INFORMATION

A full description of the PISA 2006 database and guidelines on how to analyse it in accordance with the complex methodologies used to collect and process the data is provided in the *PISA 2006 Data Analysis Manual* (OECD, forthcoming) available through www.pisa.oecd.org.

Notes

1. Two additional data files were created and sent to countries on request. One file contains the student abilities in WLEs on the 5 domains. The other file contains plausible values for students abilities on an alternative set of science scales, the content subscales.
2. The definition of the OECD average has changed between PISA 2003 and PISA 2006. In previous cycles, the OECD average was based on a pooled, equally weighted database. To compute the OECD average the data was weighted by an adjusted student weight variable that made the sum of the weights equal in all countries.
3. Note that not all participants permit the identification of all sampling strata in the database.

Reader's Guide

Country codes – the following country codes are used in this report:

OECD countries

AUS	Australia
AUT	Austria
BEL	Belgium
BEF	Belgium (French Community)
BEN	Belgium (Flemish Community)
CAN	Canada
CAE	Canada (English Community)
CAF	Canada (French Community)
CZE	Czech Republic
DNK	Denmark
FIN	Finland
FRA	France
DEU	Germany
GRC	Greece
HUN	Hungary
ISL	Iceland
IRL	Ireland
ITA	Italy
JPN	Japan
KOR	Korea
LUX	Luxembourg
LXF	Luxembourg (French Community)
LXG	Luxembourg (German Community)
MEX	Mexico
NLD	Netherlands
NZL	New Zealand
NOR	Norway
POL	Poland
PRT	Portugal
SVK	Slovak Republic
ESP	Spain
ESB	Spain (Basque Community)
ESC	Spain (Catalonian Community)
ESS	Spain (Castillian Community)
SWE	Sweden
CHE	Switzerland
CHF	Switzerland (French Community)
CHG	Switzerland (German Community)
CHI	Switzerland (Italian Community)

TUR	Turkey
GBR	United Kingdom
IRL	Ireland
SCO	Scotland
USA	United States

Partner countries and economies

ARG	Argentina
AZE	Azerbaijan
BGR	Bulgaria
BRA	Brazil
CHL	Chile
COL	Colombia
EST	Estonia
HKG	Hong Kong-China
HRV	Croatia
IDN	Indonesia
JOR	Jordan
KGZ	Kyrgyzstan
LIE	Liechtenstein
LTU	Lithuania
LVA	Latvia
LVL	Latvia (Latvian Community)
LVR	Latvia (Russian Community)
MAC	Macao-China
MNE	Montenegro
QAT	Qatar
ROU	Romania
RUS	Russian Federation
SRB	Serbia
SVN	Slovenia
TAP	Chinese Taipei
THA	Thailand
TUN	Tunisia
URY	Uruguay

FOREWORD	3
CHAPTER 1 PROGRAMME FOR INTERNATIONAL STUDENT ASSESSMENT: AN OVERVIEW	19
Participation	21
Features of PISA	22
Managing and implementing PISA	23
Organisation of this report	23
READER'S GUIDE	25
CHAPTER 2 TEST DESIGN AND TEST DEVELOPMENT	27
Test scope and format	28
Test design	28
Test development centres	29
Development timeline	30
The PISA 2006 scientific literacy framework	30
Test development – cognitive items	31
▪ Item development process.....	31
▪ National item submissions.....	33
▪ National review of items.....	34
▪ International item review.....	35
▪ Preparation of dual (English and French) source versions.....	35
Test development – attitudinal items	35
Field trial	38
▪ Field trial selection.....	38
▪ Field trial design.....	39
▪ Despatch of field trial instruments.....	40
▪ Field trial coder training.....	40
▪ Field trial coder queries.....	40
▪ Field trial outcomes.....	41
▪ National review of field trial items.....	42
Main study	42
▪ Main study science items.....	42
▪ Main study reading items.....	44
▪ Main study mathematics items.....	45
▪ Despatch of main study instruments.....	46
▪ Main study coder training.....	46
▪ Main study coder query service.....	46
▪ Review of main study item analyses.....	47

CHAPTER 3 THE DEVELOPMENT OF THE PISA CONTEXT QUESTIONNAIRES	49
Overview	50
The conceptual structure	51
▪ A conceptual framework for PISA 2006	51
Research areas in PISA 2006	55
The development of the context questionnaires	57
The coverage of the questionnaire material	58
▪ Student questionnaire	58
▪ School questionnaire	59
▪ International options	59
▪ National questionnaire material	60
The implementation of the context questionnaires	60
 CHAPTER 4 SAMPLE DESIGN	 63
Target population and overview of the sampling design	64
Population coverage, and school and student participation rate standards	65
▪ Coverage of the PISA international target population	65
▪ Accuracy and precision	66
▪ School response rates	66
▪ Student response rates	68
Main study school sample	68
▪ Definition of the national target population	68
▪ The sampling frame	69
▪ Stratification	70
▪ Assigning a measure of size to each school	74
▪ School sample selection	74
▪ PISA and TIMSS or PIRLS overlap control	76
▪ Student samples	82
 CHAPTER 5 TRANSLATION AND CULTURAL APPROPRIATENESS OF THE TEST AND SURVEY MATERIAL	 85
Introduction	86
Development of source versions	86
Double translation from two source languages	87
PISA translation and adaptation guidelines	88
Translation training session	89
Testing languages and translation/adaptation procedures	89
International verification of the national versions	91
▪ VegaSuite	93
▪ Documentation	93
▪ Verification of test units	93
▪ Verification of the booklet shell	94
▪ Final optical check	94
▪ Verification of questionnaires and manuals	94
▪ Final check of coding guides	95
▪ Verification outcomes	95

Translation and verification outcomes – national version quality	96
▪ Analyses at the country level.....	96
▪ Analyses at the item level.....	103
▪ Summary of items lost at the national level, due to translation, printing or layout errors.....	104
CHAPTER 6 FIELD OPERATIONS	105
Overview of roles and responsibilities	106
▪ National project managers.....	106
▪ School coordinators.....	107
▪ Test administrators.....	107
▪ School associates.....	108
The selection of the school sample	108
Preparation of test booklets, questionnaires and manuals	108
The selection of the student sample	109
Packaging and shipping materials	110
Receipt of materials at the national centre after testing	110
Coding of the tests and questionnaires	111
▪ Preparing for coding.....	111
▪ Logistics prior to coding.....	113
▪ Single coding design.....	115
▪ Multiple coding.....	117
▪ Managing the process coding.....	118
▪ Cross-national coding.....	120
▪ Questionnaire coding.....	120
Data entry, data checking and file submission	120
▪ Data entry.....	120
▪ Data checking.....	120
▪ Data submission.....	121
▪ After data were submitted.....	121
The main study review	121
CHAPTER 7 QUALITY ASSURANCE	123
PISA quality control	124
▪ Comprehensive operational manuals.....	124
▪ National level implementation planning document.....	124
PISA quality monitoring	124
▪ Field trial and main study review.....	124
▪ Final optical check.....	126
▪ National centre quality monitor (NCQM) visits.....	126
▪ PISA quality monitor (PQM) visits.....	126
▪ Test administration.....	127
▪ Delivery.....	128
CHAPTER 8 SURVEY WEIGHTING AND THE CALCULATION OF SAMPLING VARIANCE	129
Survey weighting	130
The school base weight	131
▪ The school weight trimming factor.....	132

<ul style="list-style-type: none"> ▪ The student base weight 132 ▪ School non-response adjustment..... 132 ▪ Grade non-response adjustment..... 134 ▪ Student non-response adjustment..... 135 ▪ Trimming student weights..... 136 ▪ Comparing the PISA 2006 student non-response adjustment strategy with the strategy used for PISA 2003 136 ▪ The comparison..... 138 	
Calculating sampling variance	139
<ul style="list-style-type: none"> ▪ The balanced repeated replication variance estimator..... 139 ▪ Reflecting weighting adjustments..... 141 ▪ Formation of variance strata..... 141 ▪ Countries where all students were selected for PISA..... 141 	
CHAPTER 9 SCALING PISA COGNITIVE DATA	143
The mixed coefficients multinomial logit model	144
<ul style="list-style-type: none"> ▪ The population model..... 145 ▪ Combined model..... 146 	
Application to PISA	146
<ul style="list-style-type: none"> ▪ National calibrations..... 146 ▪ National reports..... 147 ▪ International calibration 153 ▪ Student score generation..... 153 	
Booklet effects	155
Analysis of data with plausible values	156
Developing common scales for the purposes of trends	157
<ul style="list-style-type: none"> ▪ Linking PISA 2003 and PISA 2006 for reading and mathematics 158 ▪ Uncertainty in the link..... 158 	
CHAPTER 10 DATA MANAGEMENT PROCEDURES	163
Introduction	164
KeyQuest	167
Data management at the national centre	167
<ul style="list-style-type: none"> ▪ National modifications to the database 167 ▪ Student sampling with <i>KeyQuest</i>..... 167 ▪ Data entry quality control 167 	
Data cleaning at ACER	171
<ul style="list-style-type: none"> ▪ Recoding of national adaptations..... 171 ▪ Data cleaning organisation..... 171 ▪ Cleaning reports..... 171 ▪ General recodings..... 171 	
Final review of the data	172
<ul style="list-style-type: none"> ▪ Review of the test and questionnaire data 172 ▪ Review of the sampling data 172 	
Next steps in preparing the international database	172

CHAPTER 11 SAMPLING OUTCOMES	175
Design effects and effective sample sizes	187
▪ Variability of the design effect.....	191
▪ Design effects in PISA for performance variables.....	191
Summary analyses of the design effect	203
▪ Countries with outlying standard errors.....	205
 CHAPTER 12 SCALING OUTCOMES	 207
International characteristics of the item pool	208
▪ Test targeting.....	208
▪ Test reliability.....	208
▪ Domain inter-correlations.....	208
▪ Science scales.....	215
Scaling outcomes	216
▪ National item deletions.....	216
▪ International scaling.....	219
▪ Generating student scale scores.....	219
Test length analysis	219
Booklet effects	221
▪ Overview of the PISA cognitive reporting scales.....	232
▪ PISA overall literacy scales.....	234
▪ PISA literacy scales.....	234
▪ Special purpose scales.....	234
Observations concerning the construction of the PISA overall literacy scales	235
▪ Framework development.....	235
▪ Testing time and item characteristics.....	236
▪ Characteristics of each of the links.....	237
Transforming the plausible values to PISA scales	246
▪ Reading.....	246
▪ Mathematics.....	246
▪ Science.....	246
▪ Attitudinal scales.....	247
Link error	247
 CHAPTER 13 CODING AND MARKER RELIABILITY STUDIES	 249
Homogeneity analyses	251
Multiple marking study outcomes (variance components)	254
▪ Generalisability coefficients.....	254
International coding review	261
▪ Background to changed procedures for PISA 2006.....	261
▪ ICR procedures.....	261
▪ Outcomes.....	264
▪ Cautions.....	270

CHAPTER 14 DATA ADJUDICATION	271
Introduction	272
▪ Implementing the standards – quality assurance	272
▪ Information available for adjudication	273
▪ Data adjudication process	273
General outcomes	274
▪ Overview of response rate issues	274
▪ Detailed country comments	275
 CHAPTER 15 PROFICIENCY SCALE CONSTRUCTION	 283
Introduction	284
Development of the described scales	285
▪ Stage 1: Identifying possible scales	285
▪ Stage 2: Assigning items to scales	286
▪ Stage 3: Skills audit	286
▪ Stage 4: Analysing field trial data	286
▪ Stage 5: Defining the dimensions	287
▪ Stage 6: Revising and refining with main study data	287
▪ Stage 7: Validating	287
Defining proficiency levels	287
Reporting the results for PISA science	290
▪ Building an item map	290
▪ Levels of scientific literacy	292
▪ Interpreting the scientific literacy levels	299
 CHAPTER 16 SCALING PROCEDURES AND CONSTRUCT VALIDATION OF CONTEXT QUESTIONNAIRE DATA	 303
Overview	304
Simple questionnaire indices	304
▪ Student questionnaire indices	304
▪ School questionnaire indices	307
▪ Parent questionnaire indices	309
Scaling methodology and construct validation	310
▪ Scaling procedures	310
▪ Construct validation	312
▪ Describing questionnaire scale indices	314
Questionnaire scale indices	315
▪ Student scale indices	315
▪ School questionnaire scale indices	340
▪ Parent questionnaire scale indices	342
▪ The PISA index of economic, social and cultural status (ESCS)	346
 CHAPTER 17 VALIDATION OF THE EMBEDDED ATTITUDINAL SCALES	 351
Introduction	352
International scalability	353
▪ Analysis of item dimensionality with exploratory and confirmatory factor analysis	353
▪ Fit to item response model	353

▪ Reliability.....	355
▪ Differential item functioning.....	355
▪ Summary of scalability.....	357
Relationship and comparisons with other variables.....	357
▪ Within-country student level correlations with achievement and selected background variables.....	358
▪ Relationships between embedded scales and questionnaire.....	360
▪ Country level correlations with achievement and selected background variables.....	361
▪ Variance decomposition.....	363
▪ Observations from other cross-national data collections.....	363
▪ Summary of relations with other variables.....	364
Conclusion.....	364
CHAPTER 18 INTERNATIONAL DATABASE.....	367
Files in the database.....	368
▪ Student files.....	368
▪ School file.....	370
▪ Parent file.....	370
Records in the database.....	371
▪ Records included in the database.....	371
▪ Records excluded from the database.....	371
Representing missing data.....	371
How are students and schools identified?.....	372
Further information.....	373
REFERENCES.....	375
APPENDICES.....	379
Appendix 1 PISA 2006 main study item pool characteristics.....	380
Appendix 2 Contrast coding used in conditioning.....	389
Appendix 3 Design effect tables.....	399
Appendix 4 Changes to core questionnaire items from 2003 to 2006.....	405
Appendix 5 Mapping of ISCED to years.....	411
Appendix 6 National household possession items.....	412
Appendix 7 Exploratory and confirmatory factor analyses for the embedded items.....	414
Appendix 8 PISA consortium, staff and consultants.....	416

LIST OF BOXES

Box 1.1	Core features of PISA 2006.....	22
