ECONOMICS AND STATISTICS DEPARTMENT

WORKING PAPERS

This series of Working Papers is designed to make available, to a wider readership, selected studies which the Department has prepared for use within OECD. Authorship is generally collective, but main individual authors are named. The Papers are available both in English and French.

Comment on the Papers is invited, and may be sent to OECD, Department of Economics and Statistics, 2 rue André-Pascal, 75775 Paris Cédex 16, France. Additional copies of the Papers on a limited basis can be forwarded on request.

The Compatible Trade and Production data base (COMTAP) consists of annual statistics on production, imports and exports of manufactured goods. The key feature of this data base is that both the production and trade statistics are classified according to the same nomenclature, namely, the International Standard Industrial Classification (ISIC). The conversion of both trade and production statistics to the ISIC is approximate because there is usually no direct correspondence between the ISIC and the classification in which the trade and production data are reported to the OECD. This report describes the contents of COMTAP, some of the analytic uses to which it can be put, and the problems encountered in setting up the COMTAP data base. Finally, some examples are given of how the data base can be used to calculate "market penetration ratios" for 13 OECD countries over the period 1970 to 1983. The annexes present some of the COMTAP data in summary form.

La base de données compatibles sur le commerce et la production (COMTAP) contient des statistiques annuelles relatives à la production, aux importations et aux exportations de produits manufacturés. Sa caractéristique essentielle est de classer toutes ces statistiques selon la même nomenclature: la classification internationale type par industrie (CITI). Il n'y a habituellement pas de correspondance univoque entre la nomenclature en produits CITI et les nomenclatures selon lesquelles l'OCDE reçoit les données de commerce et de production. Pour cette raison, la conversion en produits CITI des données de commerce et de production est approximative. Ce document décrit le contenu de COMTAP, certaines des exploitations analytiques auxquelles elle peut donner lieu, et certains problèmes que posait la constitution de cette base de données. Il donne enfin des exemples de l'utilisation de COMTAP pour le calcul des indicateurs de la "pénétration du marché" pour 13 pays Membres de l'OCDE couvrant la période 1970 à 1983. Les annexes jointes présentent sous forme résumé certaines des données figurant dans les fichiers COMTAP.

COMPATIBLE TRADE AND PRODUCTION DATA BASE

1970 - 1983

Introduction

1. The first report on the OECD Compatible Trade and Production (COMTAP) data base was published as ESD Working Paper N^o. 18 in January 1985. At that time COMTAP included production data for 11 countries and covered the period 1970 to 1980. COMTAP now includes two additional countries - Finland and Norway - and it has been updated to 1983. This Working Paper follows the same format as the earlier report but gives results for this larger group of countries for the period 1970 to 1983. In addition it includes a brief description of the methods used to estimate missing data.

Contents of the data base

2. The Compatible Trade and Production Data Base (COMTAP) consists of annual statistics on production, imports and exports of manufactured goods. The key feature of COMTAP is that both the production and foreign trade data are classified according to the same nomenclature, namely the International Standard Industrial Classification of All Economic Activities (ISIC)(1).

3. The foreign trade component of COMTAP consists of the values of exports and imports reported by 24 OECD countries. Trade flows are available with full partner country detail, and both reporting countries and partner countries can be grouped together as required. For most countries foreign trade data are available from 1961 onwards. The production data in COMTAP start in 1970 and are presently available for 13 OECD countries -- Australia, Belgium(2), Canada, Finland, France, Germany, Italy, Japan, Netherlands, Norway, Sweden, United Kingdom and United States. Although only half of the total OECD membership, these countries account for over 90 per cent of OECD's total manufacturing output.

4. Both the foreign trade and production components of COMTAP are being continuously updated, although the time-lag for up-dating the production data is nearly 3 years. All data in COMTAP are expressed in current values converted to US dollars using current exchange rates.

Uses

5. From among the various analytic statistics that can be derived from COMTAP, four common ones are shown below (X, M, P are a given reporting country's exports, imports and production, and subscripts i, j, refer to partner countries and industries respectively):

- (a) $\frac{X_{ij} - M_{ij}}{P_j + M_j}$: Balance of trade with country i in goods produced by industry j, compared with total supply of j;

- (b) $\frac{M_{ij}}{P_j}$: Imports of j from country i compared with production of j;
- (c) $\frac{M_{ij}}{P_j + M_j}$: Imports of j from country i compared with total supply of j.
- (d) $\frac{M_{ij}}{P_j + M_j - X_j}$: Imports of j from country i compared with "apparent" domestic consumption of j. This is often referred to as an "import penetration ratio".

6. Ratios of this kind can be calculated for industries defined at different levels of the ISIC, and trade partners can be defined as individual countries or territories, or as any grouping of countries, such as OPEC, Pacific Basin, Least Developed, COMECON, etc. For ratios (b) and (c), X can replace M as the numerator to provide indicators of "export performance". Ratios can be calculated for each year from 1970 to 1983, and the time-period is being continuously extended.

Quality of the data

7. Several problems were encountered in building up both the foreign trade and production components of COMTAP, and these affect the reliability and interpretation of the data contained therein. As regards foreign trade statistics, the basic problem is that there is no one-to-one conversion from the commodity classification (SITC) (3) in which trade statistics are reported, into the industry classification (ISIC) required for COMTAP. Even at the 4- or 5-digit level of the classification, many SITC commodities can be produced by two or more ISIC industries. There are essentially two ways of dealing with this problem -- to assign each multi-industry commodity entirely to the single ISIC code judged to be most appropriate, or to split them among all the relevant ISIC codes. The second solution has been adopted by the ESD, which is presently using a conversion table developed jointly by the United Nations Statistical Office and the World Bank. This table distributes each multi-industry commodity among the relevant ISIC codes according to the industrial composition of trade by Common Market countries in 1975 (4).

8. The conversion table can be criticised because it applies the same fixed allocation factors for all years and to trade by all countries (including non-EEC Members). While this is clearly an unsatisfactory procedure, it nevertheless appears preferable to the alternative approach of allocating multi-industry commodities in their entirety to the single most appropriate industry. It should, in any event, be noted that only a minority of SITC codes are multi-industry, and that most commodities can be unambiguously allocated to ISIC industries.

9. The production data have been obtained by converting industrial census statistics from the national industrial classifications in which they are originally compiled into the ISIC. Often, of course, there is no one-to-one conversion from the national classifications into the ISIC, and various ad hoc solutions have had to be adopted. Other problems concern the definition of production, the treatment of secondary products, and the coverage of small establishments. These points are covered in detail in the World Bank's methodological report which is available from the Secretariat, but a few comments are needed here to help in interpreting the market penetration ratios given in the next section.

10. Most countries define production as the value of sales or deliveries, but France, Italy, Sweden and Germany (the last only for certain industries) use the concept of "gross output" as defined in the national accounts. "Gross output" includes own-account construction of fixed assets and changes in stocks of finished goods in addition to the value of goods delivered to third parties. For these countries "production" will usually be higher than for the other countries.

11. The problem of secondary production arises because the statistical units defined in industrial surveys consist of "establishments" which often produce one or more secondary products in addition to their main kind of output. For Belgium, France, Germany, Norway and Sweden attempts have been made to allocate the value of these secondary products to the correct ISIC industry, but in the other countries the value of secondary production is allocated to the ISIC industry appropriate for the establishment's principal output. For this latter group of countries, errors of unknown size are therefore scattered haphazardly among industries, since each ISIC code may include products that are characteristic of other ISIC codes, and may exclude products that have been erroneously allocated to some other industry.

12. In all countries, industrial surveys or censuses exclude small establishments, but among the countries included in COMTAP the definition of "small" varies from less than 4 employees (Australia) to less than 20 (Germany and Italy). For Japan, Canada, Finland, Norway and the United Kingdom the census data have been adjusted to include estimates for small establishments. For the other countries, the omission of small units may lead to quite serious understatement of production, particularly in light manufacturing -- clothing, leather goods, food processing for example -- where small producers may account for a significant part of total production.

13. Data are stored in COMTAP at the 1 to 4-digit level of the ISIC. However, because of the problems noted above, data at the most detailed level of the classification may contain relatively large errors, and should be used with caution. Using higher-level data will sometimes eliminate errors and will almost always reduce their relative importance.

Estimated production data

14. As noted above, the production data are taken from industrial surveys or censuses. Processing the results of these inquiries is a lengthy business, and for some countries the production data for a given year do not become available until 2 or 3 years later. A related problem is that data for particular products have to be suppressed for some years because of confidentiality restrictions. In order to complete the production file, the OECD makes estimates both to fill in missing observations and to update all countries' data to the same year. These estimates are made for 4-digit level commodities using one of the following regression models:

$$P = a_0 + a_1V \dots\dots\dots (1)$$

$$\log C = \log a_0 + a_1 \log Y \dots\dots\dots (2)$$

When (2) is used, the production data are obtained as:

$$P = C + X - M \dots\dots\dots (3),$$

where P is production of a 4-digit ISIC commodity,

C is apparent consumption of a 4-digit ISIC commodity.
(Apparent consumption is equal to production plus imports minus exports.)

V is gross value-added of the 2-digit ISIC industry corresponding to the 4-digit ISIC commodity.

Y is GDP at market prices.

X and M are exports and imports of a 4-digit ISIC commodity.

Equations (1) and (2) are estimated by ordinary least squares. For the purposes of estimation, all variables are expressed at current values in national currencies. Both V and Y are taken from the OECD file of standardized national accounts.

15. Tests carried out on the two models showed that the first model generally performs better, particularly for estimating production in industries that are sensitive to cyclical fluctuations. Model (2) is only used when V is not available. The estimates obtained by these methods are of varying quality, but are generally weaker for production of investment goods and basic metals which are particularly sensitive to fluctuations in the business cycle. Estimates are, of course, replaced by firm data as soon as results become available from industrial enquiries.

Market penetration ratios for 13 OECD countries

16. Four tables are annexed to this note. Tables A to C give the values in 1975, 1981 and 1983 of production, imports and exports, for ISIC 3 (manufacturing) and for 27 major groups of ISIC 3. These data have been used to produce the market penetration ratios given in Table D.

17. The ratios in Table D are calculated as

$$\frac{M_{ij}}{P_j + M_j - X_j} \quad 100,$$

i.e. a given reporting country's imports of the output of industry j from trade partner i, as a percentage of the reporting country's domestic consumption of j. These percentages should, in general, always take positive values and should not exceed 100. However, Table D contains several values in excess of 100, and negative values may also be obtained from the data base if market penetration ratios are calculated at the 4- or 5-digit levels of ISIC. It will be useful to consider briefly how such values may occur.

18. If $\frac{M_{ij}}{P_j + M_j - X_j} > 1$[4]

then,

$X_j > P_j + (M_j - M_{ij})$[5]

The situation described in [5], i.e. exports of j exceed domestic production of j plus imports of j from all sources except i, could only occur if goods are being exported from stocks accumulated during previous periods. While this may happen occasionally, it could not continue over long periods, and the values in excess of 100 in Table D, some of which continue for several years in succession, are almost certainly due to data errors. The most probable explanation is that P_j is under-estimated because of the omission of output from small units. It may also be due to over-estimation of X_j or under-estimation of M_j because of errors in converting from SITC to ISIC.

19. If $\frac{M_{ij}}{P_j + M_j - X_j} < 0$[6]

since M_{ij} is always positive, it follows that

$P_j + M_j - X_j < 0$[7]

or

$X_j > P_j + M_j$[8]

The situation described in [8], i.e. exports of j exceed domestic production of j plus imports of j from all sources including i, is even less plausible than the one considered earlier. As before, it could conceivably arise because a large part of exports are from stocks, but the explanation will usually be that production or imports are understated, that exports are overstated, or some combination of these errors.

20. Market penetration ratios outside the permissible range clearly have no analytic meaning. They serve to pinpoint areas where the conversion tables or the data collection procedures need to be improved, and work is currently under way within the ESD to see how these problems can be eliminated. However, while ratios outside the permissible range must be discarded, it may be that users will still be able to use one or more of the components in the ratio - P, M or X - if they can identify where the errors are most likely to lie.

21. Tables 1 through 4 summarise some of the main features of the market penetration ratios given in annex Table D for the year 1981. This is the latest year for which firm production data are available for all countries. For some countries the production data contained in COMTAP for 1981, 1982 and 1983 are Secretariat estimates.

22. Table 1 gives market penetration ratios for total manufacturing broken down by trade partners. The columns show what percentage of domestic consumption of manufactured goods in each reporting country consists of imports from the trade partners listed in the left-hand column. To put it another way, the columns show the extent to which each reporting country's

domestic market in manufactured goods has been penetrated by imports; the rows show the extent to which various trade partners' exports have succeeded in penetrating the domestic markets of the reporting countries.

23. The bottom row of Table 1 (market penetration by all trade partners together) suggests that the 11 reporting countries can be divided into three groups - a low penetrated group consisting of Japan and the United States which have ratios of less than 10 per cent, a middle group of nine countries with ratios ranging from about 20-50 per cent, and a high penetration group consisting of Belgium and Netherlands, whose penetration ratios exceed 60 per cent. In general there appears to be an inverse relationship between market penetration and country size. Large economies like the United States and Japan have low ratios, while small countries like Sweden, Norway, Netherlands and Belgium are highly penetrated. These last two countries have traditionally had very open economies, with close trading links both between themselves through the Benelux trade agreement and with their two large neighbours, France and Germany. Nevertheless the overall penetration ratios of 65 per cent and 87 per cent shown in Table 1 for Netherlands and Belgium respectively, are almost certainly overestimated due to the understatement of production because small establishments are not covered in their industrial surveys.

24. The right hand column of Table 1 shows how far the various trade partners have succeeded in penetrating the 13 reporting countries' combined market in manufactured goods. The denominator of these ratios consists of total domestic consumption in all 13 reporting countries. This is clearly the appropriate denominator for measuring penetration by non-OECD partner countries, but it is not appropriate for studying market penetration between the 13 reporting countries themselves. For example, the figure of 0.9 shown for Canada at the top of the right hand column in Table 1 means that, in 1981, imports by the other 12 reporting countries of manufactured goods from Canada amounted to 0.9 per cent of total consumption of manufactured goods in the 13 reporting countries including Canada itself. The problem with this is that since Canada cannot import from itself, the numerator and denominator are not commensurate. There are two ways to overcome this problem. The numerator could be adjusted by adding Canada's "penetration" of its own market (i.e. that part of its domestic consumption met from its own production), or the denominator could be adjusted by eliminating Canada's own consumption. The second approach has been adopted here to produce the following "adjusted ratios". These show each country's exports to the other 12 countries as a percentage of total consumption in those 12 countries.

	<u>Ca</u>	<u>US</u>	<u>Ja</u>	<u>Au</u>	<u>Be</u>	<u>Fi</u>	<u>Fr</u>	<u>Ge</u>	<u>It</u>	<u>Ne</u>	<u>No</u>	<u>Sw</u>	<u>UK</u>
Table 1 ratio	0.9	2.2	1.5	0.1	0.8	0.2	1.2	2.0	0.9	0.9	0.1	0.4	0.8
Adjusted ratio	0.9	3.7	1.8	0.1	0.8	0.2	1.4	2.2	1.0	0.9	0.1	0.4	0.9

25. As it happens, Canada's domestic consumption is so small relative to that of the whole group, that eliminating it from the denominator does not affect the ratio shown for Canada. For the United States, on the other hand,

the adjustment increases the ratio by more than two-thirds. Although the United States' exports of manufactured goods to the reporting countries are lower in absolute terms than exports from Germany, the market they penetrate is much smaller (because it excludes the United States) than the market penetrated by German exports (which only excludes Germany).

26. One of the most striking points to emerge from Table 1 is the extent to which market-penetration is essentially an inter-OECD phenomenon. By 1981, the non-OECD countries were supplying less than 4 per cent of the manufactured goods consumed in the 13 OECD countries. The seven "Newly Industrialised Countries" had achieved a penetration ratio of 1.4 per cent -- equivalent to the combined ratios of Netherlands, Norway and Sweden -- but penetration by other non-OECD areas remains at an insignificant level. The continent of Africa (South Africa excepted) supplied only 0.3 per cent of the manufactured goods consumed in the 13 OECD countries, and the ratio for "Developing Asia", which contains more than half of the world's population, is less than that of Belgium.

27. Table 2 shows the annual average growth rates over the period 1970 to 1983 of the penetration ratios of Table 1 (5). For all reporting countries together, the overall penetration ratio (the number in the bottom right-hand corner of Table 2) has been growing at about 3 1/2 per cent each year. Italy, Germany, the United States, the United Kingdom and Belgium have experienced particularly marked increases in import penetration, while the rates of growth have been particularly low in Norway, Finland and Canada.

28. In general it may be expected that there will be an inverse relationship between levels of import penetration and their growth rates; penetration ratios that were low in the initial period will tend to grow more rapidly than those that were already high in 1970. This is generally born out by comparison of the two tables, although both Australia and Japan started the period with relatively low penetration ratios and these have increased only moderately since then, while Belgium has continued to experience a rapid growth in penetration even though its domestic market was already highly penetrated in 1970.

29. With the exception of Australia and Norway, all the trade partners listed in Table 2 have increased their penetration of domestic consumption of the reporting countries. The decline for Australia is accounted for by the sharp reduction in Australia's penetration of the United Kingdom market following the latter's integration within the EEC. The right hand column shows that for intra-OECD trade Japan has achieved the largest increase in penetration, but annual growth rates of 3 per cent or more are also recorded for France and Italy. Non-OECD countries, as a whole, have been increasing their penetration of the 13 reporting countries at a substantially faster rate than the OECD countries. To a large extent, of course, the high growth shown for the non-OECD countries reflects their relatively low degree of penetration in 1970.

30. Tables 3 and 4 show penetration ratios for the 13 reporting countries broken down by major groups of the ISIC. Table 3 gives the levels of penetration in 1981, while Table 4 gives the average annual growth in penetration ratios between 1970 to 1983. Overall, the most heavily penetrated industries in 1981 were leather footwear, other leather goods, clothing, non-ferrous metals and measuring and control equipment; the least penetrated

industries were tobacco, printing and publishing and non metallic minerals. The industries where import penetration has been growing particularly rapidly include tobacco, clothing and leather footwear, while in food processing, paper and non-ferrous metals the growth of import penetration has been relatively slow.

NOTES AND REFERENCES

1. The ISIC is described in the United Nations document, Series M, No. 4, Revision 2, United Nations, New York, 1968.
2. Data for Belgium also include the production and foreign trade of Luxembourg. For the sake of brevity "Belgium" is used throughout this note to cover both Belgium and Luxembourg.
3. Standard International Trade Classification, Series M, No. 34, Revision 2, United Nations, New York, 1975.
4. Foreign trade statistics are published for EEC countries according to the NIMEXE classification. This is compatible with the SITC but much more detailed, so that commodities defined at the lower level of NIMEXE can almost always be assigned to a single ISIC industry.
5. The growth rates are calculated as $100(b-1)$ where b is estimated by regressing the penetration ratio (P) on time (t), i.e. $P = ab^t$.
